TABLE OF CONTENTS

1 INTRODUCTION

1.1 Background

Sydney Metro West (SMW) is a new underground railway connecting Greater Parramatta and the Sydney CBD. It will provide fast connections between greater Sydney's two major business centres as well as providing better access to the growing business and entertainment precincts in Olympic Park and Pyrmont, the health and medical research hub at Westmead and the future business and tourism site at The Bays.

An Environmental Impact Statement (EIS) (Jacobs/Arcadis, 2020) for the Concept and Stage 1 assessed the surface water quality impacts in response to the Secretary Environmental Assessment Requirements issued by the Department of Planning Housing and Infrastructure (DPHI). The Project was approved on 11 March 2021 (SSI 10038).

1.2 Project Description

Sydney Metro is delivering the Sydney Metro West project via several different packages, including the Western Tunnelling Package (WTP, the Project).

The WTP Project locations are from Westmead to Sydney Olympic Park. Figure 1 provides an overview of the WTP Project work sites and locations.

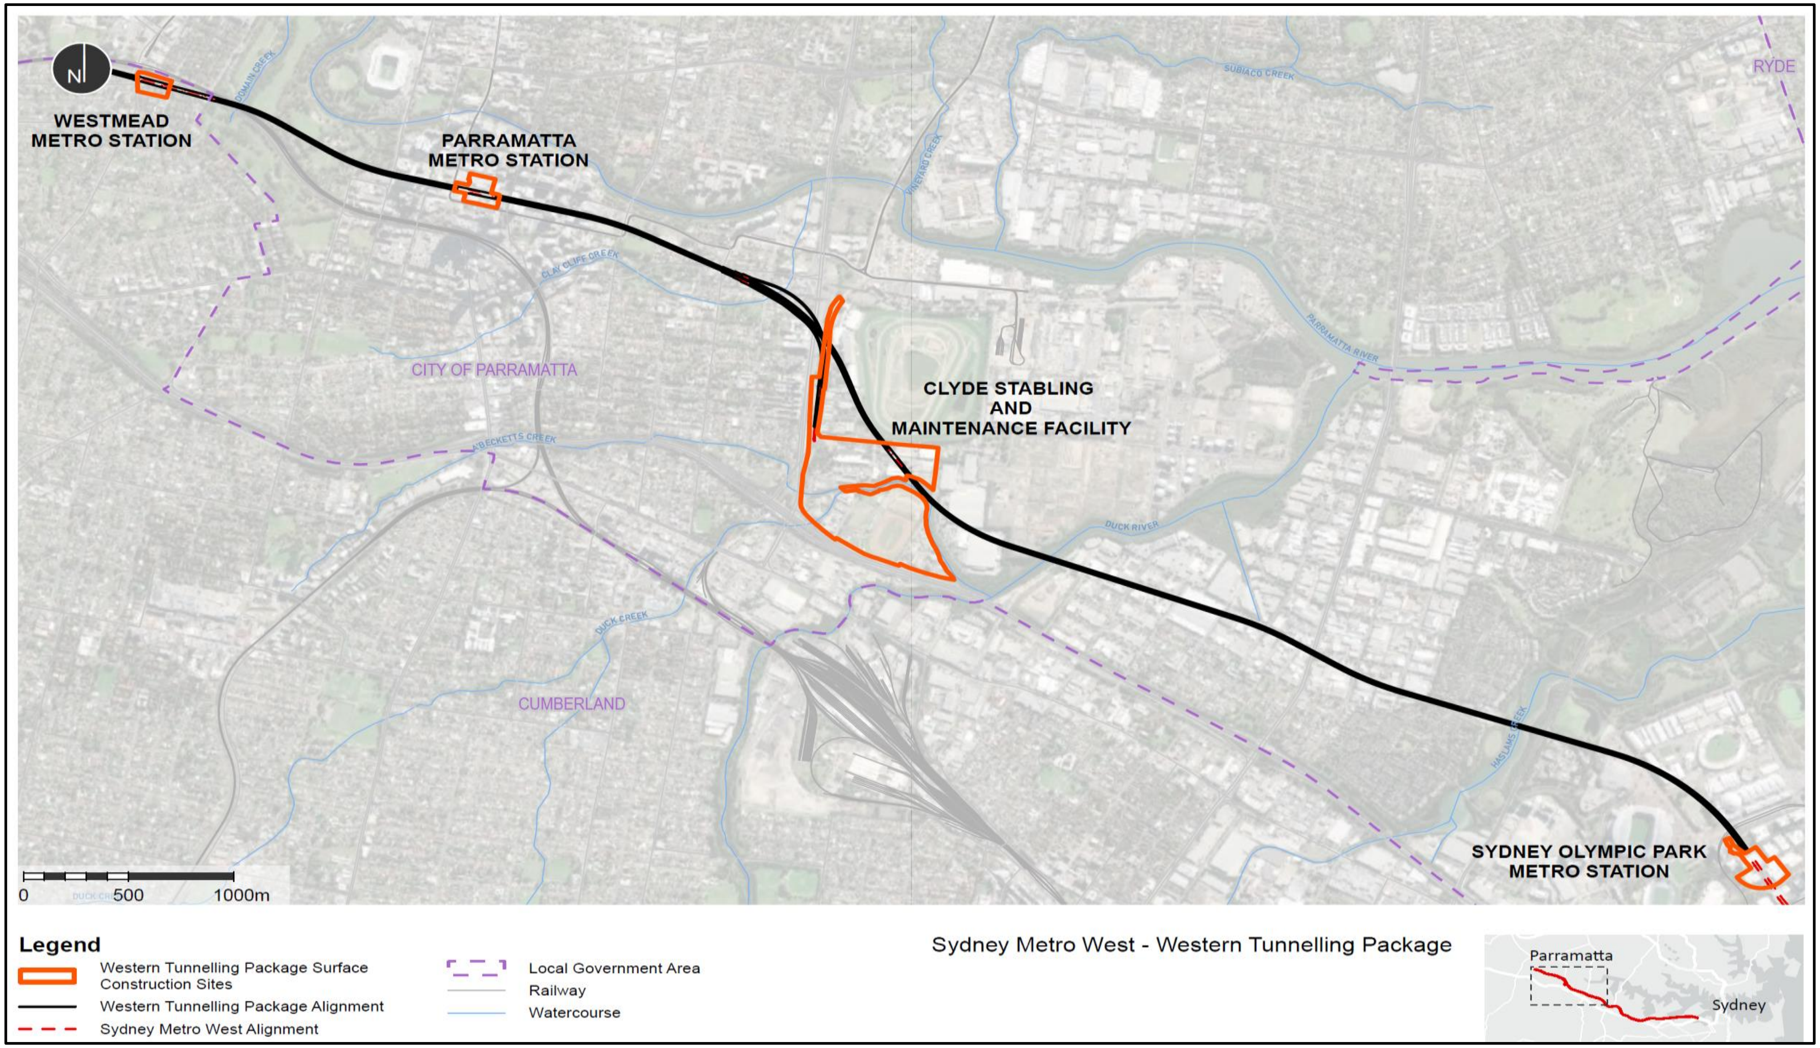

Figure 1 WTP Project Map Overview

1.3 Project Requirements

The Construction Monitoring Programs set out the requirement to develop and issue a Construction Monitoring Report (this report), collating noise and vibration, surface water and groundwater monitoring data every six months. This report collates the noise and vibration, surface water and groundwater monitoring undertaken during the reporting period of 20th July 2024 to the 19th January 2025.

The Project requirements relevant to the preparation of this Construction Monitoring Report are identified in Table 1. A document reference is also included to indicate where the requirement is addressed in this Monitoring Report or other documents.

Table 1 Monitoring Report Compliance Matrix.

1.4 Summary of Works

The construction activities and associated plant and equipment used at each of the construction sites are outlined in Table 2**.** These activities generally aligned with those observed to be underway on-site during the works during the reporting period:

Table 2 Construction Activities undertaken during the reporting period.

SITE	CONSTRUCTION ACTIVITIES	WATER TREATMENT PLANT DISCHARGING?
Westmead	• Box Excavation (with Hydraulic Hammers) • Box Excavation (fully enclosed) • Box Excavation – rock bolting/shotcrete (with acoustic shed/cover) • Mined Tunnel Excavation • Delivery of Equipment (including heavy oversized overmass deliveries and plant) & Spoil Haulage	No

	• General operation of ancillary facility • Gantry crane operation • Installation of Monitoring Equipment • Operation of the Water Treatment Plant (no discharge offsite) • Form, reinforcement and concrete pours for station box blinding slabs	
Parramatta	• Archaeological clearance • Removal and/or relocating utilities • Establishing concrete slabs or piling platforms and D-Wall Infrastructure • Station Box D-Wall Excavation & Construction • FRP (Form, Reo & Pour) – Concrete Works Capping Beam • Internal haul road and station box bridge • Box excavation Ground Support – Internal Struts & Waler Installation • Box Excavation to ~26m • Delivery of Equipment / General Truck Movements • General operation of ancillary facilities • Nozzle construction and demobilisation – fissure grouting • Nozzle construction and demobilisation – canopy tube installation • Nozzle construction and demobilisation – concrete D-wall removal • Nozzle construction and demobilisation – ground support and excavation • Nozzle construction and demobilisation – tunnel spoil loadout • Nozzle construction and demobilisation – Rock bolting • Tunnel invert concreting work • General operation of ancillary facilities • Instrumentation and monitoring works within and adjacent to site. • Installation of Monitoring Equipment • Station box maintenance works • On-going use of Water Treatment Plant	Yes (To EPL discharge point 5)
Clyde Dive[1]	• Bulk earthworks • Decline structure construction (Piling) • Decline structure construction (capping beam) • Spur Line lining • Spur line and Junction excavation • Junction lining • General operation of ancillary facilities • Grout pump station operation - Lining Erection Machine (LEM)	Yes – Transfer to Rosehill Water Treatment Plant
Clyde MSF[1]	• Construction site establishment/demolition of structures • Traffic adjustments • Haul roads and site amenities • PASS treatment • Bulk Earthworks • Drainage installation & combined services route • Utility trench and services corridor works • FRP works, Concrete works and retaining walls • Water conveyance structure – construction and finishing works • Unwin Street Diversion – construction • Unwin Street Overpass delivery • General operation of ancillary facility • Utility adjustment works • Clearing Vegetation + implementation of ERSED controls • Ground Improvement work	Yes – Transfer to Rosehill Water Treatment Plant

	• General operation of ancillary facility • Contamination remediation • Creek adjustment works	
Rosehill[1]	• FRP concrete work • Delivery of segments and equipment • TBM construction, excavation and spoil handling • General operation of ancillary facility • Spoil haulage • Water treatment plant operation • Grout plant operation	Yes, discharged to EPL point four (Duck River)
Sydney Olympic Park	• Instrumentation and monitoring works within and adjacent to site • TBM retrieval works including shotcreting • Tunnel nozzle construction and concreting works • General operation of ancillary facility	Yes, transfer to the Rosehill Water Treatment Plant.

[1] The Clyde Maintenance Stabling Facility consists of three sub-sites, specifically the Clyde Dive, Clyde MSF and Rosehill construction sites.

2 SUMMARY OF RESULTS

2.1 Noise and Vibration Monitoring Report Summary

Refer to Attachment A for the Construction Noise and Vibration Monitoring Report July 2024 to January 2025 (SMWSTWTP-GLO-1NL-NV-RPT-000005) for the reporting period.

2.1.1 Air borne Noise

Noise and vibration monitoring between July 2024 and January 2025 was undertaken in accordance with the WTP Noise and Vibration Management Plan (NVMP), Noise and Vibration Monitoring Program (NVMoP) and Detailed Noise and Vibration Impact Statement (DNVIS). Attended monitoring was conducted in line with the Project EPL and NVMP.

During the reporting period a total of 97 attended monitoring sessions were recorded. Of the 61 monitoring sessions identified to exceed the Predicted Noise Level (PNL) or Noise Management Level (NML), these exceedances were attributed to high ambient noise levels or non-construction related noise sources and therefore were not associated with the Project. Further, where the observed noise level exceeded the predicted noise levels, the mitigation measures emplaced remained appropriate for the observed noise impact level, in accordance with the Sydney Metro Construction Noise and Vibration Strategy (CNVS). A detailed attended noise monitoring report for individual monitoring sessions is provided within the tables of Attachment 2 of the Noise and Vibration Construction Monitoring Report No.4 (Attachment 1 of this document).

During the reporting period, unattended noise monitoring was also undertaken. A total of fourteen (14) devices were located across five (5) construction sites, namely Clyde Dive, Clyde MSF, Parramatta, Sydney Olympic Park and Westmead. A total of 869 noise exceedances above NMLs were identified at the monitoring locations across the sites, however the primary source of noise was consistently identified to be extraneous noise sources. This was further verified with attended noise monitoring. This was further verified with attended monitoring as outlined in Attachment 2 of the NV Construction Monitoring Report (Attachment 1 of this document).

Ground borne Noise

Where relevant, ground borne noise monitoring was undertaken concurrently with vibration monitoring for human comfort screening levels. Monitoring was undertaken in the most habitable room of a property or in the lowest floor of a commercial building and the closest point to office rooms. During the reporting period a total of four (4) attended monitoring sessions were undertaken for ground borne noise and of these, none were identified to be above noise management levels (NML).

2.1.2 Vibration – Human Comfort

During the reporting period, a total of 21 real time vibration monitoring locations were selected across four (4) sites, namely Clyde MSF, Parramatta, Rosehill and Westmead to undertake monitoring for Human Comfort vibration levels. Recorded VDV during the reporting period indicated significantly lower predicted VDV values on receivers compared to DNVIS worst case modelling. VDV tended to stay below preferred values (daytime: 0.2m/s1/75, night-time: 0.13 m/s1/75) as discussed in Section 2.3 of this report. Instances of high VDV were investigated by the project and were commonly due to human interference such as bumps by workers.

2.1.3 Vibration – Building and Structures

During the reporting period, a total of 186 vibration exceedance triggers were received through the real time vibration monitoring devices for both Parramatta and Westmead construction sites only. Parramatta accounted for 111 exceedance event triggers across three (3) monitoring locations. Westmead accounted for 75 exceedance event triggers across three (3) monitoring locations.

Following identification of these exceedance events, the activities were immediately investigated to determine the cause of these events and to review construction activities as necessary. In most cases the cause for the exceedances were attributed to a number of factors including:

- Mechanical bumps of the monitors during handling or set up
- Bumps of the monitors due to worker movements
- Interferences due to non-work-related factors such as rainfall.
- Unidentified sources – however unrelated to construction as exceedances were observed during periods of no construction activities, or vibration intensive activities such as excavation or hammering for example.

Where an exceedance did not relate to the events listed above, a review confirmed the cause as being unrelated to construction given their instantaneous and discontinuous nature. Further, where available GLC would review CCTV records to support explanation for these observed peaks in the vibration record.

2.2 Surface Water Quality Summary

Surface Water Quality Monitoring between July 2024 and January 2025 was undertaken in accordance with the WTP Surface Water Quality Monitoring Program (SWQMoP). Refer to Attachment B for the full report (SMWSTWTP-GLO-1NL-EN-RPT-000015).

In accordance with the recommendations of the SWQ Monitoring Report No.4:

- Two sampling points (SW04 and SW05) were removed due to the removal of two new points, SW07 and SW11.
- Sampling point SW01 was relocated approximately 100m upstream of its initial location due to the encroachment of construction activities and a reduction in access capabilities.
- Removal of sampling point SW12 from the monitoring schedule due to the absence of GLC activities in the proximity of Sydney Olympic Park given there were no discharges to the adjacent receiving waterbodies.

GLC collected surface water samples from a total of 11 sampling points across the project and tested these samples against their chemical and physical properties (As per the NSW Water Quality Objectives and the Australian and New-Zealand Guidelines 2018). There was a total of 27 instances recorded, during which a downstream water parameter(‘s) was higher than the upstream sampling location. In all instances, these findings could not be directly attributed to construction activities, or could be directly correlated with external factors unrelated to the project, such as recent rainfall, run off from adjacent residential, commercial or industrial activities, as well as field equipment errors.

Results obtained from this monitoring period indicated that there has not been a degradation of the surrounding surface water network due to construction. Results are generally consistent with the adopted assessment criteria and pre-construction baseline water quality data.

2.3 Groundwater Summary

Groundwater Monitoring for the reporting period of July 2024 to January 2025 was undertaken in accordance with the WTP Groundwater Monitoring Program (GMoP). Refer to Attachment B for the complete Groundwater Monitoring Report (SMWSTWTP-GLO-1NL-EN-RPT-000016).

2.3.1 Water Treatment Plant discharge summary:

During the reporting period, two water treatment plants were operational and discharging to the environment. To permit discharges to the environment, water quality proofing of the Water Treatment Plants occurred at the Parramatta and Rosehill Water Treatment Plants (W.T.P). These are summarised as below:

- 11 sampling events occurred at the Rosehill Water Treatment Plant
- 8 sampling events occurred at the Parramatta Water Plant, and
- No sampling events occurred at the Westmead Water Treatment Plant. All water collected by the W.T.P was treated and re-used on site. .

Where sampling and discharge occurred, each sampling event consisted of a pre-treatment and post-treatment sample, which were assessed against the discharge criteria stipulated in the Project Environmental Protection License (21676).

Of the 11 sampling events for Rosehill, two returned elevated concentrations for Nitrogen. Investigations into these exceedances were undertaken:

- In the context of elevated Nitrogen– this was attributed to particularly high concentrations of these analytes in the influent for a short period of time. This was likely due to anomalies in the sources of the influent, such as activities occurring on site or potential contamination sources from groundwater.

In all instances where these exceedances were observed, targeted testing was undertaken to verify if the observed results were an anomaly or attributed to the testing process. In both instances, elevated Nitrogen levels are instantaneous, with subsequent tests being compliant with the EPL discharge criteria. To further support these findings, results collected from the Surface Water Quality Monitoring Report for the designated upstream (SW08) and downstream (SW03) sampling points produced nitrogen levels which were consistent with historic sampling rounds indicating no potential impact.

On December 19th 2024, a variation to the EPL was approved to support the increase in discharge criteria for Chromium VI and Total Nitrogen. These are summarised as below:
Chromium VI:

- 50th and 100th Percentile limits of 15ug/L and 30ug/L, respectively.

Total Nitrogen:

- 90th Percentile and 100th Percentile limits of 1200ug/L and 1800ug/L, respectively.

The Parramatta Construction Water Treatment Plant was commissioned after three (3) subsequent compliant results were returned on the 8th March 2024. As per the results, all sampling events undertaken during the reporting period were compliant with the discharge requirement of the EPL 21676 for the Parramatta Construction Water Treatment Plant. Over the reporting period, there were two periods where the demand to reuse treated water on-site has matched that of supply from the Parramatta construction water treatment plant and there was a suspension in discharge to the environment. These periods have included:

- 18th July 2024 to 31st July 2024
- 15th August 2024 to 16th August 2024

2.3.2 Groundwater level change summary:

For groundwater level monitoring, reportable changes were identified at five (5) groundwater monitoring wells (GWMWs). Those changes observed in the GWMWs were at the Clyde Dive and Rosehill sites, where dewatering activities were taking place. Reportable changes were identified from comparing current drawdown to modelled predictions of drawdown. There are no reportable changes when comparing to Aquifer Interference Policy (AIP) criteria. Therefore, the recommended action is to continue monitoring of the groundwater level and drawdown.

2.3.3 Groundwater quality observations

Revised performance criteria were generated in June 2024, as well as the process for managing exceedances against the performance criteria and was documented in the revised Groundwater Monitoring Program (SMWSTWTPGLO-1NL-EN-PRG-000002, Rev. D). The reportable changes in groundwater quality identified against the performance criteria are detailed below:

August 2024 Sampling event:

Clyde MSF

- SMW_WTP_BH25_s – Exceedances against ammonia, total nitrogen, and chlorobenzene were identified
- CZ1_BH13 – Exceedances against PFOS

Parramatta

- SMW_BH004_s - Exceedances against Copper and Nitrate

October 2024 Sampling event:

Clyde MSF

- SMW_WTP_BH25_s – Exceedances against ammonia, total nitrogen and chlorobenzene.
- SMW_WTP_BH25_w – Exceedances against total nitrogen.
- CZ1_BH13 – Exceedances against PFOS

Clyde Dive

- GALC_MW16_w - Exceedances against Total phosphorus
- SMW_ENV009_w – Exceedances against Total phosphorus

Parramatta:

- PM_BH14_w – Exceedances against Copper
- SMW_BH004_s – Exceedances against copper and nitrate

Westmead

- SMW_WTP_BH03A_w - Exceedances against Total phosphorus

For these parameters, a Mann-Kendall analysis was undertaken. The Mann-Kendall analysis identified that two reportable events were considered statistically significant (PM_BH14_w (copper) and SMW_WTP_BH03A_w (total phosphorus)). A risk assessment was therefore completed to determine whether management actions were needed, in accordance with the Rev D GMP (Section 4.2). The risk assessment determined that management actions were not needed, and continuation of quarterly monitoring is required. .

TABLE OF CONTENTS

1 INTRODUCTION

1.1 Project Description

Sydney Metro West (SMW) is a new underground railway connecting Greater Parramatta and the Sydney CBD. It will provide fast connections between greater Sydney's two major business centres as well as providing better access to the growing business and entertainment precincts in Olympic Park and Pyrmont, the health and medical research hub at Westmead and the future business and tourism site at The Bays.

An Environmental Impact Statement (EIS) (Jacobs/Arcadis, 2020) for the Concept and Stage 1 assessed the Noise and vibration impacts in response to the Secretary Environmental Assessment Requirements issued by the NSW Department of Planning, Housing, and Infrastructure (DPHI). The Project was approved on 11 March 2021 (SSI 10038).

Sydney Metro is delivering the Sydney Metro West project via several different packages, including the Western Tunnelling Package (WTP, the Project). **Figure 1** is an overview map outlining the extent of the Project.

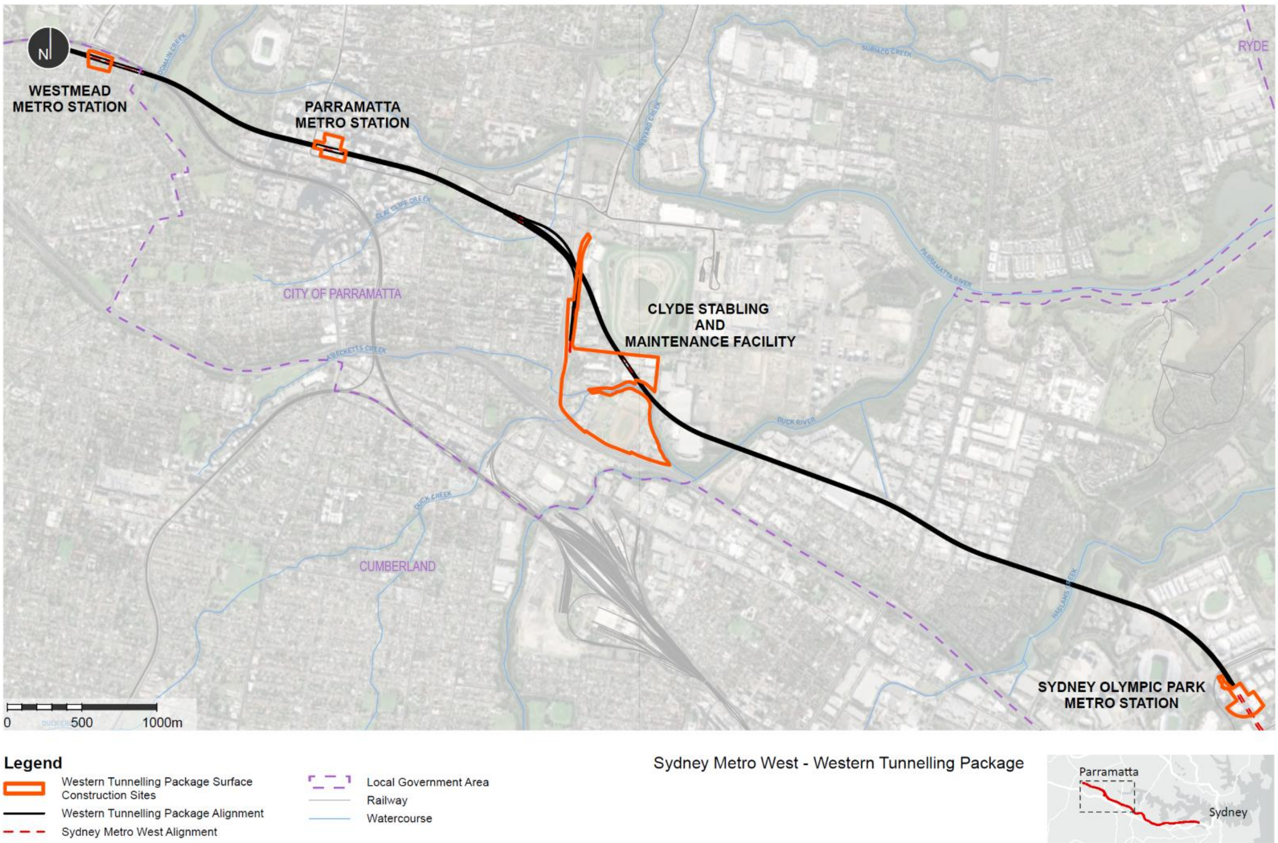

Figure 1 WTP Project Map Overview

1.2 Project Requirements

The Noise and Vibration Monitoring Program Rev G (NVMoP) sets out the requirement to develop and issue a Construction Noise and Vibration Monitoring Report (this report), collating construction noise and vibration monitoring data. This report collates noise and vibration monitoring undertaken between the 20th of July 2024 and 19th January 2025

The Project requirements relevant to the preparation of this Monitoring Report are identified in **Table 1**. A document reference is also included to indicate where the requirement is addressed in this Monitoring Report or other documents. Additional monitoring requirements are outlined in the NVMoP and construction noise and vibration project requirements are outlined in the Construction Noise and Vibration Management Plan (NVMP).

Table 1 Monitoring Report Compliance Matrix

Reference	Requirement	Document Reference
Condition of Approval C23	The results of the Construction Monitoring Programs must be submitted to the Planning Secretary, ER and relevant regulatory agencies, for information in the form of a Construction Monitoring Report at the frequency identified in the relevant Construction Monitoring Program.	This document
CEMF 8.2	c. Noise and vibration monitoring would be undertaken for construction as specified in the CNVS. The following compliance records would be kept by Principal Contractors: Records of noise and vibration monitoring results against appropriate NMLs and vibration criteria	This report collates records of noise and vibration monitoring results against appropriate NMLs and vibration criteria, refer Appendices A-C.
REMM NV20	Undertake consultation with the Rosehill Gardens Racecourse and an equine veterinary expert to inform construction noise and vibration objectives for this sensitive receiver. d. Achievement of objectives are to be demonstrated in accordance with Noise and Vibration Construction Monitoring Program required by Conditions C15 and C16 and would include reference to equine behavioural responses where feasible.	Following completion of the Equine Study in August 2022, there was no change to Noise Objectives. Data included at Appendices A-C includes monitoring results in accordance with the NVMoP.
CNVS 6.2	**Noise Monitoring** • Noise monitoring where noise goals predicted to be exceeded All noise monitoring results would be assessed against the nominated noise goals and compiled into a report to be forwarded to the construction contractor and project manager. Reporting would be submitted to the construction contractor and project manager within one week of being undertaken or at weekly intervals for continuous monitoring. • All noise monitoring reports would also be made available to the public through a publicly accessible website.	This report includes tabulated monitoring data collected during the reporting period (Section 4.1 of this report). This monitoring report would be made publicly available on the GLC WTP website.

Reference	Requirement	Document Reference
CNVS 6.3	**Vibration Monitoring** • Vibration monitoring where exceedance of cosmetic damage criteria expected, or where human response exceedance is expected and where concerns raised. All vibration monitoring results would be assessed against the nominated vibration goals and compiled into a report to be forwarded to the construction contractor and project manager. Reporting would be submitted to the construction contractor and project manager within one week of being undertaken or at weekly intervals for continuous monitoring. • All vibration monitoring reports would also be made available to the public through the publicly accessible website.	This report includes tabulated monitoring data collected during the reporting period (Section 4.2 of this report). This monitoring report would be made publicly available on the GLC WTP website.
NVMoP	GLC data summary reports presenting tabulated monitoring data collected during the reporting period and highlighting performance criteria exceedances. Applicable management responses will be documented.	This report
NVMoP	The six-monthly monitoring reports will be provided to the relevant authorities within 10 business days of receiving endorsement by the AA.	Section 1.3

1.3 Endorsement and Publication

In accordance with the NVMoP, this Construction Monitoring Report has been provided to the independent Acoustics Advisor (AA) and Sydney Metro (SM) for review, and endorsement sought from the AA. Following endorsement, this report will be issued to the DPHI, (Environmental Representative) ER and relevant regulatory authorities for information in accordance with MCoA C23. In line with MCoA B11(e), a copy of this (Noise and Vibration) NV Construction Monitoring Report will be consolidated with GLC's other Construction Monitoring Reports (CMR's) and published on the project website as required following submission of the last Construction Monitoring Report to DPHI.

2 DESCRIPTION OF WORKS

2.1 Summary of works

The construction activities, and associated plant and equipment used at each of the construction sites, are outlined in Table 2**.** Construction activities are derived from the modelled work scenarios from the Western Tunnelling Package Detailed Noise and Vibration Impact Statement (DNVIS). These activities generally aligned with those observed to be underway on site during the works during the reporting period:

Table 2 Construction Activities undertaken during the reporting period

SITE	CONSTRUCTION ACTIVTIES	EQUIPMENT LIST
Westmead	• Box Excavation (with Hydraulic Hammers) (WM.16b) • Box Excavation (with acoustic shed/cover) (WM.17a) • Box Excavation – rock bolting/shotcrete (with acoustic shed/cover) (WM.17b) • Mined Tunnel Excavation (WM.18) • Delivery of Equipment & Spoil Haulage (WM.19) • Delivery of Equipment / Heavy Vehicle Deliveries (WM19b) • Delivery of Equipment / Heavy Vehicle Deliveries (WM19c) • General operation of ancillary facility (WM.21) • Gantry crane operation (WM.22) • Permanent Tunnel Lining and FRP (WM.23 • Installation of Monitoring Equipment (WM.24)	Plant and equipment consistent with modelling list of the WTP DNVIS (Attachment 2 of DNVIS)
Parramatta	• Archaeological clearance (PM.03) • Removal and/or relocating utilities (PM.04) • Establishing concrete slabs or piling platforms and D-Wall Infrastructure – Approved Hours (PM.08a) • Station Box D-Wall Excavation & Construction – Approved Hours (PM.09a) • FRP (Form, Reo & Pour) – Concrete Works Capping Beam (PM.11) • Internal haul road and station box bridge (PM.12) • Box excavation Ground Support – Internal Struts & Waler Installation (PM.14) • Box Excavation to ~26m (PM.15) • Delivery of Equipment / General Truck Movements (PM.16) • Nozzle construction and demobilisation – fissure grouting (PM.17a) • Nozzle construction and demobilisation – canopy tube installation (PM17.b) • Nozzle construction and demobilisation – concrete D-wall removal (PM17.c) • Nozzle construction and demobilisation – ground support and excavation (PM17.d) • Nozzle construction and demobilisation – tunnel spoil loadout (PM.17e)	Plant and equipment consistent with modelling list of the WTP DNVIS (Attachment 2 of DNVIS)

SITE	CONSTRUCTION ACTIVTIES	EQUIPMENT LIST
	• Nozzle construction and demobilisation – Rock bolting (PM.17f) • Tunnel invert concreting work (PM.19) • General operation of ancillary facilities (PM.18) • Installation of Monitoring Equipment (PM.22) • Station box maintenance works (PM28) • Water Management/dewatering (PM.29)	
Clyde Dive[1]	• Bulk earthworks (CD.06) • Decline structure construction (10% overlap with capping beam) (CD.08c) • Spur line excavation (CD.09) • Spur Line lining (CD.10) • Junction excavation (CD.11) • Junction lining (CD.12) • General operation of ancillary facilities (CD.14)	Plant and equipment consistent with modelling list of the WTP DNVIS (Attachment 2 of DNVIS)
Clyde MSF[1]	• Construction site establishment/demolition of structures (MSF.01a) • Traffic adjustments (MSF.01b) • Haul roads and site amenities (MSF.02) • Earthworks (MSF.03) • Drainage installation & combined services route (MSF.04) • Utility trench and services corridor (MSF.05) • FRP works, Concrete works and retaining walls (MSF.06) • Water conveyance structure – construction (MSF.07a) • Water Conveyance Structure – Finishing Works (MSF.08) • Unwin Street Diversion – construction (MSF.09) • Unwin Street Diversion – Finishing Works (MSF.10) • Unwin Street Overpass (Piling, FRP, Earthworks, Heavy Lifting) (MSF.12a) • Unwin Streat Overpass Delivery (MSF.12b) • General operation of ancillary facility (MSF.13) • Utility adjustment works (MSF.14) • Clearing Vegetation (MSF.15) • Ground Improvement work (MSF.16) • Creek Adjustment Works (MSF.17)	Plant and equipment consistent with modelling list of the WTP DNVIS (Attachment 2 of DNVIS)
Rosehill[1]	• FRP concrete work (RH.19) • Delivery of equipment (RH.20) • TBM Support and Spoil Handling (RH.021) • General operation of ancillary facility (RH.22)	Plant and equipment consistent with modelling list of the WTP DNVIS (Attachment 2 of DNVIS)
Sydney Olympic Park	• TBM Retrieval (SOP.02) • TBM Retrieval, material load out and shotcrete of cross passages (SOP.02b) • Nozzle Construction (SOP.03) • General operation of ancillary facility (SOP.04)	Plant and equipment consistent with modelling list of the WTP DNVIS (Attachment 2 of DNVIS)

SITE	CONSTRUCTION ACTIVTIES	EQUIPMENT LIST
	• Cross passage concrete pours (SOP.07)	

[1] The Clyde Maintenance Stabling Facility consists of three sub-sites, specifically the Clyde Dive, Clyde MSF and Rosehill construction sites.

2.2 Noise Management Objectives

2.2.1 Noise management levels - Residential receivers

The existing noise environment was quantified (via measurement) at representative Noise Catchment Areas (NCAs) surrounding the Project site during preparation of the Environmental Impact Statement (EIS). A summary of the measured ambient Rating Background noise Levels (RBLs) is presented in Table 3 below.

Table 3 Summary of Project Noise Management Levels

LOCATION ID	NCA	RECEIVER TYPE	NOISE MANAGEMENT LEVEL LAeq (15minute) (dBA) Approved Construction Hours (RBL +10dB)	Out of Hours (RBL +5dB)			SLEEP DISTURBANCE SCREENING LEVEL (dBA)
			DAY	DAY	EVENING	NIGHT	NIGHT
B.02	NCA01	Residential	58	53	51	46	56
B.01	NCA02	Residential	59	54	52	42	52
B.03	NCA03	Residential	68	63	58	48	58
B.04	NCA04	Residential	61	56	53	46	56
B.05	NCA05	Residential	60	55	54	50	60
B.06	NCA06	Residential	62	57	56	49	59
B.07	NCA07	Residential	56	51	49	46	56
B.08	NCA08	Residential	58	53	53	51	61
B.09	NCA09	Residential	58	53	51	46	56

Baseline data from the EIS has been reviewed and is representative of ambient noise in the Project area. No further baseline monitoring was undertaken prior to commencement or following the start of construction of the WTP.

2.2.2 Noise management levels – 'Other Sensitive' receivers

NMLs for 'Other Sensitive' Receivers are adopted from the Interim Construction Noise Guideline (ICNG) and are presented in Table 4 below.

Table 4 NML for 'Other Sensitive' Receivers - ICNG

LAND USE	ASSESSMENT PERIOD	NOISE MANAGEMENT LEVEL LAeq(15minute) (dBA)	
		Internal	External
Classrooms at schools and other educational institutions	When in use	45	55[1]
Hospital wards and operating theatres	When in use	45	65[2]
Places of worship	When in use	45	55[1]
Active recreation areas (characterised by sporting activities and activities which generate noise)	When in use	-	65
Passive recreation areas (characterised by contemplative activities that generate little noise)	When in use	-	60[3]
Commercial	When in use	-	70
Industrial	When in use	-	75

Note 1: It is assumed that these receivers have windows partially open for ventilation which results in internal noise levels being around 10 dB lower than the external noise level.

Note 2: It is assumed that these receivers have fixed windows which conservatively results in internal noise levels being around 20 dB lower than the external noise level.

Note 3: Rosehill Gardens Racecourse Stables adopts ‘Passive recreation area’ NMLs

2.2.3 Noise management levels – Ground-borne Noise

Ground-borne Noise Management Objectives are adopted from the EIS, ICNG, and Sydney Metro CNVS and are presented in Table 5 Below

Table 5 Ground-borne Noise Management Objectives

RECEIVER TYPE	NOISE MANAGEMENT LEVEL LAeq(15minute) (dBA)		
	DAYTIME	EVENING	NIGHTTIME
Residential	45	40	35
Commercial	50	N/A	N/A

2.3 Vibration Management Objectives

Vibration Management Objectives align with those described in the Sydney Metro CNVS and NVMP. These objectives are based of the British Standard BS 7385 and German Standard DIN 4150 for cosmetic damage. While *Assessing Vibration: a technical guideline* (DEC 2006) Provides criteria for human comfort and is based on Vibration Dose Value (VDV). VDV accumulates vibration energy over the daytime and night-time assessment periods. It is dependent on the level of vibration as well as the duration. Vibration criteria values are presented below in Tables 6, 7, 8.

During the reporting period, GLC were required to undertake vibration intensive activities including vibratory rolling and excavation with a large hydraulic hammer (18-34Tonne) within the safe working distances of the RTA Heritage Façade in Clyde MSF. In accordance with REMM NV16, GLC obtained a more detailed assessment of the structure in consultation with a structural engineer, as well as heritage and noise and vibration specialist to determine acceptable vibration levels and mitigation measures to ensure the heritage fabric is adequately monitored and managed. These criteria have been summarised below:

- Cosmetic damage – 25mm/s
- Minor damage – 62.5mm/s
- Major damage – 100mm/s

The results of monitoring in relation to this specialist advice are discussed in Section 4.3.2.

Table 6 Human Comfort Vibration - Vibration Dose Values for Intermittent Vibration

BUILDING TYPE	ASSESSMENT PERIOD	VIBRATION DOSE VALUE (m/s$^{1.75}$)	
		Preferred	Maximum
Critical Working Areas (e.g. operating theatres or laboratories)	Day or night-time	0.10	0.20
Residential	Daytime	0.20	0.40
	Night-time	0.13	0.26
Offices, schools, educational institutions, and places of worship	Day or night-time	0.40	0.80
Workshops	Day or night-time	0.80	1.60

Table 7 Cosmetic Damage – BS 7385 Transient Vibration Values for Minimal Risk of Damage

GROUP	BUILDING TYPE	PEAK COMPONENT PARTICLE VELOCITY IN FREQUENCY RANGE OF PREDOMINANT PULSE	
		4 Hz to 15 Hz	15 Hz and Above
1	Reinforced or framed structures. Industrial and heavy commercial buildings	50 mm/s at 4 Hz and above	
2	Unreinforced or light framed structures. Residential or light commercial type buildings	15 mm/s at 4 Hz increasing to 20 mm/s at 15 Hz	20 mm/s at 15 Hz increasing to 50 mm/s at 40 Hz and above

There are no structurally unsound buildings located on the project (including heritage buildings). GLC however utilise more conservative criteria in SiteHive to provide greater capacity to respond to vibration intensive works, well before the cosmetic damage criteria is neared. I.e 2.5mm/s, 5mm/s or 7.5mm/s depending on specific site location and activities occurring.

Table 8 Cosmetic Damage – DIN 4150 Guideline Values for Short-term Vibration on Structures

GROUP	BUILDING TYPE	GUIDELINE VALUES VIBRATION VELOCITY (mm/s)				
		Foundation, All Directions at a Frequency of			Topmost Floor, Horizontal	Floor Slabs, Vertical
		1 to 10 Hz	10 to 50 Hz	50 to 100 Hz	All frequencies	All frequencies
1	Buildings used for commercial purposes, industrial buildings and buildings of similar design	20	20 to 40	40 to 50	40	20
2	Residential buildings and buildings of similar design and/or occupancy	5	5 to 15	15 to 20	15	20
3	Structures that, because of their particular sensitivity to vibration, cannot be classified as Group 1 or 2 and are of great intrinsic value (e.g. heritage listed buildings)	3	3 to 8	8 to 10	8	20

3 MONITORING METHODOLOGY

The monitoring methodology is outlined in the NVMoP. The methodology has been developed in accordance with the NVMP, NVMoP, DNVIS and policy, guidelines, and standards as listed below:

- *Interim Construction Noise Guideline* (ICNG) (DECC, 2009)
- *Sydney Metro Construction Noise and Vibration Standard* (Sydney Metro CNVS) (Sydney Metro, 2020).

A summary of the noise and vibration monitoring methodology is provided below.

3.1 Overview

The Construction Monitoring Program outlines the monitoring methodology. Modelling includes but is not limited to monitoring under the following circumstances:

- Commencement of works and at regular intervals throughout works.
- Where it has been identified that activities may exceed relevant noise and vibration goals
- In consideration of a complaint received
- During approved Out of Hours Work (OOHW) activities
- As identified by additional mitigation measures
- Where ground-borne noise or vibration generating activities are undertaken within safe working distances,
- Vibration monitoring at sensitive buildings or structures, and
- Vibration and ground-borne noise monitoring for human comfort vibration levels in response to complaints or where a risk was identified.

3.1.1 Noise Monitoring

The noise measurement procedures employed throughout the monitoring were established in accordance with the requirements of *Australian Standard (AS) 1055:2018 Acoustics - Description and Measurement of Environmental Noise*. Attended noise measurements were conducted by an operator using a calibrated handheld Type 1 'integrating averaging' sound level meter. All measurements were completed with the sound level meter mounted to a tripod stand at an approximate height of 1.2 to 1.5 metres above the ground.

Noise monitoring included recording of all noise emission sources (extraneous or otherwise) and meteorological conditions (such as wind speed, temperature, precipitation, and cloud cover etc). Relevant measurement parameters (i.e. LAeq, Lmin, Lmax, L10 and L90) were recorded in dBA. All noise samples were recorded using the "fast" time response of the sound level meter.

Unless it was unavoidable, noise monitoring was not completed within 3.5 metres of any reflective structure or wall, unless behind a barrier. A reduction of up to 2.5 dBA was not applied to the measured ambient or site noise contribution (LAeq, 15 minutes in dBA) as the barrier was reducing noise emissions from site and in general did not increase noise due to the reflective properties of the surface.

Noise monitoring was typically not undertaken during periods of heavy rain or where wind speeds exceeded 5 m/s at the microphone. Noise monitoring data impacted by extraneous weather conditions was typically excluded from the report.

3.1.2 Ground-borne Noise Monitoring

The Ground-borne noise monitoring methodology followed is similar to the methodology described in Section 3.1.1 in this report. Ground-borne noise monitoring was undertaken using a calibrated handheld Type 1 'integrating averaging' sound level meter.

All measurements were completed with the sound level meter mounted to a tripod, at a height of 1.2 to 1.5 metres above the ground. Measurements were typically taken a minimum of 1 metre from walls or other reflective surfaces. Ground-borne noise monitoring was undertaken alongside vibration measurements, where practicable.

Monitoring was undertaken in the most affected habitable room of the sensitive receiver where possible. Where multiple habitable rooms were available, the room with the best shielding from airborne noise intrusions was selected to allow ground-borne noise to be dominant.

In instances where residents did not allow access to monitor, the project aimed to monitor at the next best available location. Where permitted, audio recordings were taken to support ground-borne monitoring data.

3.1.3 Vibration Monitoring

All vibration monitoring results were assessed and reported against the acceptable values of human exposure and structural/cosmetic damage outlined in the Sydney Metro CNVS and the Project's NVMP.

Unattended vibration monitoring was undertaken with due regard to and in accordance with the requirements of the Sydney Metro CNVS and ICNG using a calibrated vibration logger.

The monitoring device was placed (fixed to the structure or embedded in the ground nearby the structure) at the potentially most affected receiver/s or structure/s prior to works commencing.

The device was set to continuously record vibration levels (PPV data in mm/s) at sample intervals (e.g. 5 second, 15 second or 1 minute) appropriate to the activity.

VDV data in $m/s^{1.75}$ for human comfort were sampled in daytime and night-time intervals at sensitive receivers for tunnelling works.

3.1.4 Monitoring Equipment

All noise and vibration measurements were conducted by suitably experienced personnel with due regard to, and in accordance with, the relevant local and international standards for environmental monitoring.

Noise and Vibration equipment was calibrated and checked to the manufacturer's specification, with certification at intervals that align with the individual product specification requirements. Equipment used on the project during the reporting period have been summarised in **Table 9**, with the corresponding Calibration certificates appended in **Attachment 5**.

The equipment used on the project are as follows:

- Site Hive Hexanode Multi (real time noise monitor for surveillance purposes)
- Rion NL-52 handheld noise monitor (for compliance monitoring).
- Omnidots SWARM V2.2cw vibration monitor (for compliance monitoring).
    - These are privately owned but managed by SiteHive and their online program.
- Site Hive Hexanode Vibration monitor (for compliance monitoring).

Table 9 Calibration dates of all noise and vibration monitors used on the project during the reporting period.

3.2 Monitoring Locations

Generally, noise monitoring was carried out at the most sensitive receivers and as prescribed in the DNVIS. GLC has determined the most appropriate monitoring locations based on construction activities, community feedback, monitoring personnel safety and location of OOHW activities. Maps outlining the attended noise monitoring locations for the reporting period can be found in **Attachment 1**.

4 RESULTS

4.1 Noise Monitoring

During the reporting period a total of 97 attended monitoring sessions were recorded. GLC further classified these monitoring events into the following categories to better interpret the findings (Refer **Attachment 2**). These two classifications and findings include:

1) Monitoring events where the Predicted Noise Level (PNL) was higher than the Noise Management Level (NML)
   This categorisation uses a PNL as the target noise level to which noise monitoring results are compared against, including the implementation of appropriate mitigation measures.
   a. A total of 12 events occurred which were above the PNL
   b. A total of 31 events were equal to or lower than the PNL

2) Monitoring events where the NML was higher than the PNL.
   This categorisation uses the NML as the target noise level to which noise monitoring results are compared against, given these works would be categorised as low impact activities.
   a. A total of 49 events occurred which were above the NML
   b. A total of 5 events were equal to or lower than the NML

Of the 61 monitoring sessions identified to exceed the PNL and NML (based on the above classifications respectively), these exceedances were attributed to high ambient noise levels or non-construction related noise sources and therefore were not associated with the Project. The causes for these exceedances have been documented in the notes accompanying Tables 2.1-2.4 in **Attachment 2**. Further, where the observed noise level exceeded the relevant noise target, the mitigation measures emplaced remained appropriate, in accordance with the Sydney Metro CNVS. A detailed attended noise monitoring record for individual monitoring sessions is provided within the tables of **Attachment 2.**

During the reporting period, unattended noise monitoring was also undertaken. A total of fourteen (14) devices were located across five (5) construction sites, namely Clyde Dive, Clyde MSF, Parramatta, Sydney Olympic Park and Westmead.

A total of 869 noise exceedances above NMLs were identified at the monitoring locations across the sites, however the primary source of noise was consistently identified to be extraneous noise sources. This was further verified with attended noise monitoring as outlined in **Attachment 2**. A summary of unattended noise monitoring results has been included in **Attachment 3**. Note, some minor gaps in the unattended noise monitoring results can be attributed to typical technical and mechanical issues with the equipment including but not limited to breaks in power supply or breakdowns. Where technical or mechanical issues are identified, GLC had these rectified as can be observed by the return of normal operations and continued collection of monitoring data.

4.2 Ground borne Noise Monitoring

Where relevant, ground borne noise monitoring was undertaken concurrently with vibration monitoring for human comfort screening levels. Monitoring was undertaken in the most habitable room of a property or in the lowest floor of a commercial building and the closest point to office rooms. During the reporting timeframe a total of four (4) attended monitoring sessions were undertaken for ground borne noise and of these, none were identified to be above noise management levels (NML). These findings are presented within **Attachment 2-Table 2.3** of this report.

Gaining permission to access properties from residents however presented a significant barrier to monitoring over the reporting period. This was compounded by some difficulties that arose between coordinating the timing of monitoring with vibration activities, with the time of obtaining permission to access properties.

Ground borne noise monitoring results can be found in **Attachment 2.**

4.3 Vibration Monitoring

All vibration monitoring sessions during the reporting period were undertaken using real-time monitors that were positioned according to relevant site-specific activities and vibration monitoring requirements. Monitoring locations can be found in **Attachment 1**. Monitoring locations used to assess any potential cosmetic damages were generally located on the boundary of the nearest sensitive receiver, closest to the activity. Monitoring locations for human comfort were selected on their proximity to vibration intensive activities and following receipt of permission from building owners, managers, strata or residents, to allow installation of monitors within habitable rooms or agreed location

A number of conservative vibration damage screening criteria was utilised, depending on the location of works in proximity to different structures. It is noted that no structurally unsound buildings have been identified in proximity to the works, and therefore the more stringent screening criteria from DIN 4150-3 do not apply. Instead, BS 7385:1993 is utilised for residential, commercial and heritage buildings (Refer Section 6.3.2 of the NVMP Rev G). For structures deemed non-heritage or structurally sound, a conservative vibration screening level of 5mm/s is adopted as an early warning trigger, prompting a review of activities and work methodologies, as relevant.

Alerts are received through the SiteHive real-time monitoring platform. All vibration triggers are investigated as per the procedure outlined in the Project's NVMoP. GLC notes that, while there have been vibration events recorded over the reporting period, there has been no exceedance of the BS 7385:1993 criteria for structural or cosmetic damage observed. Vibration triggers were attributed to non-reportable, single time events such as monitor displacement, works occurring on top of monitor location, human interaction and were predominantly not associated with GLC works.

4.3.1 Human comfort

During the reporting period, a total of 21 real time vibration monitoring locations were selected across four (4) sites, namely Clyde MSF, Parramatta, Rosehill and Westmead to undertake monitoring for Human Comfort vibration levels. These locations are depicted in **Attachment 1**.

Vibration levels relating to human comfort occurred in response to mined tunnel works at the Rosehill, Parramatta and Westmead sites, as well as rock-breaker excavations for the cross passage works at Sydney Olympic Park. DNVIS worst case modelling for TBM vibration effects between the Rosehill, Westmead and Sydney Olympic Park sites showed no impact on receivers for the extent of excavation that occurred during the reporting period.

Recorded VDV during the reporting period indicated significantly lower predicted VDV values on receivers compared to DNVIS worst case modelling. VDV tended to stay below preferred values (daytime: 0.2m/s$^{1/75}$, night-time: 0.13 m/s$^{1/75}$) as discussed in Section 2.3 of this report. Instances of high VDV were investigated by the project and were commonly due to human interference as detailed below. Detailed VDV and event results can be found in **Attachment 3.**

4.3.2 Vibration Events – Buildings and Structures

During the reporting period, a total of 186 vibration exceedance triggers were received through the real time vibration monitoring devices for both Parramatta and Westmead construction sites only. Parramatta accounted for 111 exceedance event triggers across three (3) monitoring locations. Westmead accounted for 75 exceedance event triggers across three (3) monitoring locations.

Following identification of these exceedance events, the activities were immediately investigated to determine the cause of these events and to review construction activities as necessary. In most cases the cause for the exceedances were attributed to a number of factors including:

- Mechanical bumps of the monitors during handling or set up
- Bumps of the monitors due to worker movements
- Interferences due to non-work-related factors such as rainfall.
- Unidentified sources – however unrelated to construction as exceedances were observed during periods of no construction activities, or vibration intensive activities such as excavation or hammering for example.

Where an exceedance did not relate to the events listed above, a review confirmed the cause as being unrelated to construction given their instantaneous and discontinuous nature. Further, where available GLC would review CCTV records to support explanation for these observed peaks in the vibration record. This therefore supports the conclusion that these instantaneous peaks would have been caused by external sources, unrelated to construction works themselves. The results of these exceedances can be found in **Attachment 4**.

4.3.2.1 RTA Façade – Monitoring in response to Specialist Heritage/Vibration Advice

Vibration intensive works occurred adjacent to the RTA Façade to support the Unwin Street diversion and bio-retention basin works between approximately October 2024 and February 2025. Vibration monitoring indicated that there was no exceedance of the revised vibration criteria throughout the period of vibration intensive works. Monitoring data and evidence of compliance has since been supplied throughout the reporting period to the ER and Independent Auditor as part of the 6-Monthly Compliance Assessment and Independent Audit (March 2025).

4.4 Complaints Monitoring

During the reporting period only one (1) monitoring session occurred as the result of a community complaint as required by the NVMoP. The remainder of GLC's offers (13) for attended monitoring were declined by the complainants. Attended monitoring results showed one session was compliant with implemented mitigation measures. **Table 10** lists all instances where GLC offered to undertake attended monitoring, including those which were declined. Results of attended monitoring can be observed in **Attachment 2**.

Table 10 Summary of all offers of attended monitoring during the reporting period.

ID	Date	Time	Location	Details of response and monitoring event
5715	19/07/2024	09:58	Bailey Street Westmead	GLC received a complaint for noise. GLC offered the resident attended noise monitoring at their premises. The initial date proposed was not suitable given GLC would not undertake hammering. The respondent failed to schedule another date. However, review of the real time monitoring

				data indicated compliance with the noise and vibration criteria (including for human comfort).
5716	19/07/2024	23:54	Figtree drive Sydney Olympic Park	Stakeholder complained about loud machinery and metal grinding at night. At the time of the complaint, GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. Attended monitoring was offered on two accounts and declined on both attempts. Review of the real time monitoring data and prior attended noise monitoring data for the building. Both of which indicated compliance with the NML.
5720	23/07/2024	00:34	Figtree drive Sydney Olympic Park	Stakeholder complained about very loud machinery. At the time of the complaint, GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. GLC reviewed real time data, which indicated 24-hour construction activities under the EPL were being undertaken and were compliant with the noise assessments undertaken. Attended monitoring was offered but has been declined to date.
5732	25/07/2024	00:57	Figtree drive Sydney Olympic Park	Stakeholder complained about banging metal, hammering and drilling. At the time of the complaint, GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. GLC Environment Team reviewed the available real-time noise data for the time of the complaint. The activities and equipment are consistent with the noise assessment approved for the 24-hour works under the EPL. GLC have made multiple offers for attended noise monitoring however the stakeholder has refused or not responded. GLC are awaiting approval from the strata committee if noise monitoring could be undertaken inside common property.
5733	25/07/2024	01:53	Figtree drive Sydney Olympic Park	Stakeholder complained about banging metal, hammering and drilling. At the time of the complaint, GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. GLC Environment Team reviewed the available real-time noise data for the time of the complaint. The activities and equipment are consistent with the noise assessment approved for the 24-hour works under the EPL. GLC have made multiple offers for attended noise monitoring however the stakeholder has refused or not responded. GLC are awaiting approval from the strata committee if noise monitoring could be undertaken inside common property.
5734	25/07/2024	03:50	Figtree drive Sydney Olympic Park	Stakeholder complained about banging metal, hammering, drilling and sawing. At the time of the complaint, GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. The

				complainant agreed to attended noise monitoring at their property on 25 July 2024 at 11pm-12am. Attended monitoring results were consistent with earlier work weeks and was compliant with the noise predictions and Licence.
5749	02/08/2024	01:10	Figtree drive Sydney Olympic Park	Stakeholder complained about banging metal and reversing vehicles. At the time of the complaint, GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. GLC Environment Team reviewed the available real-time noise data for the time of the complaint. The activities and equipment are consistent with the noise assessment approved for the 24-hour works under the EPL. As of 2/08, two attended noise monitoring sessions have been completed (25/7/2024) within the stakeholder's property. No further response has been received from the strata manager about noise monitoring within the common area of the property. Noise monitoring indicated work were compliant with the relevant noise management levels. Stakeholder agreed to having a noise monitor placed on their balcony following the July 25th visit. GLC are currently procuring the noise monitor to place in their property for a period of a week.[1]
5750	02/08/2024	01:45	Figtree drive Sydney Olympic Park	Stakeholder complained about banging metal and reversing vehicles. GLC was undertaking works to disassemble tunnel boring machine equipment at the bottom of the station box approximately 350m north-west of the Stakeholders address. Stakeholder agreed to having a noise monitor placed on their balcony following the July 25th visit, GLC are currently procuring the noise monitor to place in their property for a period of a week.[1]
5754	05/08/2024	10:50	Bailey Street Westmead	Stakeholder complained they experienced hammering noise day and night over a couple of days. GLC were not completing any work activities on street level near Bailey Street, Westmead at the time of the complaint, and only undertaking tunnelling. GLC offered attended noise monitoring, which the Stakeholder declined.
5782	16/08/2024	11:57	Day Street Silverwater	Complainant called regarding noise and vibration from OOH work. The complainant was advised that new machinery is being used and that benching excavation within cross passage will occur up to 24/5 this week. An offer was made for noise monitoring but was declined. The complainant informed GLC that if they change their mind, they would be In touch.

5884	22/10/2024	08:48	Bailey Street, Westmead.	Stakeholder complained about noise and vibration felt at the resident's unit. GLC determined they were not completing any work activities on street level near Bailey at the time of the complaint but were undertaking waterproofing and steelwork activities within the station cavern and stub tunnels underneath the acoustic shed. No real-time vibration or ground-borne noise data is available at the Stakeholders property address. However, GLC offered the stakeholder attended noise and vibration monitoring, which has been declined to date.
5905	01/11/2024	11:18	George Street Parramatta	Complaint regarding vibration impacts during standard construction hours received. GLC were using a vibratory roller to compact backfill near the George Street (northern) side of the Parramatta Metro construction site at the time of the complaint. Real time data from a vibration monitor (41-45 George Street) indicated there were no exceedances of vibration criteria (human comfort or cosmetic damage), however GLC offered the business vibration monitoring, which has been accepted. A real-time monitoring device has since been installed in the building. Nil exceedances observed.
5966	05/12/2024	15:35	Hawkesbury Road Westmead	Complaint was received regarding noise from vacuum truck. GLC was undertaking excavation works on the Hawkesbury Road footpath to install new power cables and conduits. The works were being undertaken using a vacuum truck to avoid impacting tree roots and services. The Environmental Advisor had undertaken noise monitoring on the day of the complaint, which produced results that were below predictions and below the high noise impact threshold (75dBA). Noise blankets on temporary fencing had been installed adjacent the vacuum truck between the works and the receiver. Further Noise monitoring at residence was offered but declined.

Note 1 – GLC procured a SiteHive Noise monitor for the affected resident however failed to receive any response despite engagement for installation. As such, this monitor was never installed. Note however, attended monitoring results are available for the resident. Refer Attachment 2, Table 2.4.

5 CONCLUSION

Noise and vibration monitoring of the WTP Project during the reporting period of 20 July 2024 to 19 January 2025 was undertaken in accordance with the NVMP and NVMoP. Attended monitoring was conducted in line with the Project EPL, NVMP and NVMoP.

Generally, where attended noise monitoring events resulted in the LAeq above modelled noise levels, it was due to heightened ambient noise levels of the surrounding environment.

Vibration exceedances were due to extraneous variables such as local displacement or human interaction, or other factors unrelated to construction works themselves as determined by GLC's investigations into construction works following each exceedance.

Noise and vibration monitoring will continue in accordance with the Project NVMP, NVMoP and DNVIS.

Attachment 2 – Noise Monitoring Summary

Table 2.1 – Results of attended noise monitoring where the Predicted Noise Level (PNL) is higher than the Noise Management Level (NML)

Note: The last column presents the output from the Noise monitor following the completion of the monitoring event and is not a measure of compliance with the approval. Where there is an exceedance indicated, this finding should be read with the accompanying notes for the monitoring event, on account all exceedances were not attributed to construction activities alone.

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
6/08/2024	20:06:00	Parramatta	Nca03 - 119 Macquarie Street	Parra115 B Box Excavation. E5-E6 & Parra110 Canopy Tubes Installation	69.3	55	50.1	53.1	59.8	82.5	Distance from works location: 40m. Distance from receiver: 5m Type of receiver: commercial Dominant noise source: consistently site excavation works. Largest spike from buses on smith st behind monitor location. Works were separated by site hoarding. Higher noise contributions from external sources including traffic and transport.	Below or equal to the PNL
6/08/2024	20:35:00	Parramatta	25 Smith St Parramatta	Parra115 B - Box Excavation E5-E6 & Parra110 canopy tubes installation	76.1	70	51.3	54.4	59.5	76.1	Distance from works location: 90m Distance from receiver: 10m. Type of receiver: educational. Dominant noise source: Works were audible sporadically and below PNL. Loudest noises were from traffic and transport and non GLC construction works east of monitor location	Below or equal to the PNL
14/08/2024	10:36:00	Parramatta	48 George St Parramatta	PM.17c, PM.17a, PM.15, PM.05, PM.16, PM.22. PM.03	72.8	70	56.9	60	67.1	85.7	Distance from receiver 1m. Distance from works 20m. Works were mostly inaudible throughout the duration of monitoring. Dominant noise source was non project related traffic.	Below or equal to the PNL
15/08/2024	21:33:00	Westmead	NCA 02 23-25 Hassall Street	West_105 OSOM demob of excavator	64.4	52	46.2	49.5	65.1	82.3	Modelling undertaken during anticipated loudest noise impacts (low loaders leaving site) - Observed Laeq was slightly above noise predictions however this was due to non-project related noise impacts.	Exceeds the PNL
20/08/2024	20:50:00	Parramatta	25 Smith St Parramatta	Parra123 Nozzle Construction - Ground Excavation - Rock Hammering	83.3	70	49.2	52.7	62.6	78.5	Distance from source: 200m approx. Distance from receiver: 10m. Main source of noise: traffic on the intersection Works were inaudible throughout monitoring period, noise sources included traffic, pedestrians and building noise. Results were below PNL, mitigation in place including 3 hours on and 1 hour off. Site hoarding, community notification and noise monitoring was implemented.	Below or equal to the PNL
20/08/2024	21:30:00	Parramatta	45 Macquarie Street, Parramatta	Parra123 Nozzle Construction - Ground Excavation - Rock Hammering	58	56	50.5	54.6	61.8	78.7	Distance to source: approx 200m. Distance from receiver: 10m. Main source of noise: vehicles on intersection, pedestrian beeper and ventilation hum. When the works were audible for small periods of the monitoring period, they were generally observed to be below PNL. LAeq was a result of noise caused by extraneous sources such as traffic noise.	Exceeds the PNL
21/08/2024	0:55:00	Parramatta	45 Macquarie Street, Parramatta	Parra123 Nozzle Construction - Ground Excavation - Rock Hammering	56.8	48	46.1	47.7	55.4	72.2	Distance to source 70m horizontal, 15m vertical inside box excavation Distance to receiver: 3m. Main source of noise: Construction works as rock hammering, with elevated reading from tram passes Results displayed works were audible but below PNL by approx 7db. Works were above NML but mitigation measures in place including community notification, noise monitoring, site hoarding, respite as 3 on 1 off of high impact activities.	Below or equal to the PNL
21/08/2024	20:06:00	Parramatta	Nca03 - 119 Macquarie Street	Parra123 - Nozzle Construction Ground Excavation - Rock Hammering	66.3	55	47.9	51.3	59.1	79.9	Distance to source 80m. Distance to receiver 10m. Receiver type: educational. Main source of noise: traffic and transport on interchange, bus and trams produce elevated readings, quieter periods site works audible as rock hammering. Works were audible during the monitoring periods with results displaying 7db below PNL. Mitigation measures in place including community notification, noise monitoring, site hoarding, respite as 3 hours on and 1 hour off for high impact activities.	Below or equal to the PNL
21/08/2024	20:30:00	Parramatta	NCA03 169 Macquarie St, Parramatta	Parra123 Nozzle Construction Ground Excavation - Rock Hammering	67.5	55	54.1	56.6	63	82.9	Distance from source: Approx. 50m slant distance. Distance from receiver: 5m. Dominant source of noise: construction works as rock hammering of nozzles in box and road traffic. Works were audible intermittently throughout monitoring period however were always below predicted impacts. Mitigation measures implemented included, community notification and noise monitoring.	Below or equal to the PNL
11/09/2024	19:18:00	Parramatta	25 Smith St Parramatta	Parra-123 Nozzle Construction - Ground Excavation - Rock Hammering	83.3	70	59	59.5	63.6	76.2	Distance to source 70m horizontal, works were undertaken within the nozzles at an approximate depth of 15m. Distance to receiver: Approx. 3m. Main source of noise: pedestrians and tram passing. Construction works were audible intermittently (breaking). Noise impacts were below predictions,	Below or equal to the PNL
11/09/2024	19:23:00	Parramatta	NCA-03 - Parramatta Mission 119 Macquarie Street	Parra-123 Nozzle Construction Ground Excavation - Rock Hammering	66.3	55	53.4	55	53.7	74	Distance to source: Approx. 200m - works undertaken within the nozzles at an approximate depth of 15m. Distance to receiver: Approx. 10m. Dominant noise source: not project related noise - vehicles, pedestrians talking, pedestrian beeper and ventilation hum. Works were compliant with the Predicted Noise Level.	Below or equal to the PNL

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
11/09/2024	22:30:00	Parramatta	45 Macquarie Street, Parramatta	Parra-123 - Nozzle Construction Ground Excavation - Rock Hammering	56.8	48	51	54.5	62.9	86	Verification monitoring being competed for OOH Permit PARRA-134. Surface works being undertaken include concrete pump set-up and telehandler operation. Works inside of station box being undertaken including shotcreting, EWP and excavator operation. Distance from Receiver: 2m. Distance from Source (surface): 68m. Minimal to no members of the public present during monitoring; construction works inaudible; loudest noise observed was a tram bell when departing light rail station; Church and Parramatta Mission closed with no activity. Observed LAeq level was a product of extraneous noise sources (tram bell, higher than normal ambient noise levels).	Exceeds the PNL
15/09/2024	8:20:00	Parramatta	NCA-03 - Parramatta Mission 119 Macquarie Street	Nozzle Support Works - OOH Permit PARRA-134	57.7	55	49.5	50.6	54.3	72.4	Verification monitoring being competed for OOH Permit PARRA-134. Surface works being undertaken include concrete pump set-up and concrete agitator discharging. Works inside of station box being undertaken including shotcreting, EWP and excavator operation. Distance from Receiver: 2m. Distance from Source (surface): 68m. Construction activities inaudible during monitoring event. All observed noise was attributed to non-construction related sources.	Below or equal to the PNL
15/09/2024	11:20:00	Parramatta	NCA-03 - Parramatta Mission 119 Macquarie Street	Nozzle Support Works - OOH Permit PARRA-134	57.7	55	50.4	53.5	60.5	82.6	Verification monitoring being competed for OOH Permit PARRA-134. Surface works being undertaken include concrete pump set-up and concrete agitator discharging. Works inside of station box being undertaken including shotcreting, EWP and excavator operation. Distance from Receiver: 2m. Distance from Source (surface): 331m - Busy intersection throughout entire 15-minute monitoring exercise. Constant car noise & pedestrian crossing green light blinker/beeper. - Windy with gusts of wind that increased the noise level display. 500 degree steakhouse (restaurant) had music playing throughout the monitoring event that was highly audible. Construction activities inaudible throughout entire monitoring event. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
20/09/2024	9:39:00	Westmead	31 Bailey Street, Westmead	Removal of acoustic/spoil shed (approved hours) - WM.025	113	59	47.7	51.7	59	74.4	Throughout monitoring there was constant disturbances associated with strong winds, alongside this there was ongoing urban traffic and council sidewalk maintenance which consisted with the constant usage of a whipper snipper; however, these conditions were not of high noise and caused minimal interference with this noise monitoring. The result displayed below PNL readings, mitigation measures included community notification and noise monitoring.	Below or equal to the PNL
27/09/2024	6:31:00	Westmead	NCA02 - 123-129 Hawkesbury Road	Early mobilisation of concrete pump - West 112	49.1	42	47.9	49.6	57.5	74.3	Mobilisation of concrete pump through Hawksbury Road gate - distance approx. 40m. Distance of monitor to receiver: 5m. Receiver type: residential. Main source of noise: non-project related traffic. Result: monitoring displayed above PNL throughout the session. Pump mobilisation was inaudible throughout the duration of monitoring. Site noise consisted of a gate opening and shutting. Observed LAeq level was a product of extraneous noise sources and not construction.	Exceeds the PNL
27/09/2024	19:45:00	Parramatta	Nca03 - 119 Macquarie Street	PARRA-133 Steel Installations & PARRA-136 Nozzle Drilling	56.4	54	49.1	51.3	58.6	79.3	Distance from site activities = 330m. Distance of monitor to receiver = 5m. Generally a lot of traffic at the junction and noise coming from the building reception. Construction noise inaudible at the location throughout the whole monitoring event as the noise environment was heavily influenced by traffic and pedestrian activities. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
28/09/2024	22:54:00	Parramatta	Nca03 - 119 Macquarie Street	PARRA-133 Steel Installations & PARRA-136 Nozzle Drilling	56.4	55	46.6	48.1	56.5	76.7	Distance from site activities = 330m. Distance of monitor to receiver = 5m. A lot of noise and interaction was emanating from the bar behind the monitoring location. Shouting from the pub on going throughout the 15min of recording as well as heavy traffic. Construction noise inaudible at the location throughout the whole monitoring event. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
30/09/2024	20:55:00	Parramatta	NCA-03 - Parramatta Mission 119 Macquarie Street	Parra123b Nozzle Construction - Ground Support	66.3	55	48.7	N/A	58.2	77.7	Location is a place of Worship that is uninhabited during the evenings/nights. Hammering dominant noise. Drilling into d- wall (Alfabs) 2x EWP operating 1x excavator hammering 2 hours of hammering remaining after this monitoring period. Works displayed above NML readings but below PNL . Mitigation measures included community notification and noise monitoring.	Below or equal to the PNL
9/10/2024	20:04:00	Parramatta	Nca03 - 119 Macquarie Street	PARRA-133B Steel Installation & PARRA-136 Nozzles Excavation & Drilling	51.4		50.4	52.2	59.7	82.1	Distance from works 200m, distance from receiver 15m, main source of noise during the monitoring event was attributed to traffic at the intersection. Results were above PNL however works were inaudible throughout monitoring period. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
11/10/2024	10:34:00	Clyde MSF	Rosehill Stables	Rockbreaking and excavation on northbound lane (approved hours) MSF.09	83.9	60	55.6	58.4	62.4	75.8	Monitoring Distance to source: 30t excavator moving materials and unloading trucks 8-12m. 13 t excavator rock breaking 15-20m Distance of monitor to receiver: 5m to the side. Not enough space between hoarding and stables to have a representative measurement. Receiver type: Passive recreation ATC stables, Main source of noise: construction noise audible as material movements and loadout. Highest spikes produced by unloading bucket of material into empty truck trailer. Intermittent rock breaking also main source when combined with loadout of materials. Results displayed an LAeq of 62.4dBA which is above the NML60db. However considerably below the PNL 83.9db. Several mitigation measures were implemented including working behind noise blankets	Below or equal to the PNL

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
											and hoarding. 3 on 1 off respite, using minimum sized equipment as feasible and reasonable to do so, Staging of works and noise monitoring.	
11/10/2024	11:00:00	Clyde MSF	Rosehill Stables	Vac truck for NDD drainage pits (approved hours) MSF.09	80.9	60	52.3	556	67.4	76.1	Monitoring Distance to source: vac truck 15m, excavator rockbreaking 30m, excavator moving materials with bucket 15m. Distance of monitor to receiver: 5m Receiver type: Passive recreation ATC stables. Main source of noise: vac truck was the loudest construction activity, some heavy haulage passing on Unwin st was louder than the rockbreaking. Overall construction noise was the main source of noise. Results displayed lower LAeq 67.4db than the predicted noise level 80.9db. Mitigation measure in place including noise blanket atf, additional localised ATF. 3 on 1 off respite. minimal sized plant feasible and reasonable to complete the work and noise monitoring	Below or equal to the PNL
14/10/2024	22:25:00	Westmead	NCA02 - 10-12 Hassall Street Westmead	Tunnel lining and FRP works	51.7	42	45.1	N/A	57.2	86.8	Works not audible. Gentle hum audible from site. Traffic and train noise dominant sources of noise. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
14/10/2024	22:57:00	Westmead	NCA02 - 154 Hawkesbury Road, Westmead	West 107B Lining and FRP	43.9	42	40.3	N/A	61.1	90.7	Works inaudible. Dominant noise from road traffic. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
27/10/2024	7:19:00	Clyde MSF	Rosehill Stables	MSF051C_Northern Diversion Unwin Street	82.4	60	48.4	52.1	56.7	76.9	Monitoring Distance to source: 5m. Distance of monitor to receiver: 5m Receiver type: Passive Recreation Main source of noise: Construction works - site works were the dominant noise source. Mitigation measures including noise blankets were observed to be effective, community notification and noise monitoring, works were below predictions and NMLs.	Below or equal to the PNL
27/10/2024	8:02:00	Clyde MSF	69 Penelope Lucas Lane, Granville	MSF051C	54.4	50	48.2	51.8	55.4	67.4	Monitoring Distance to source: Approx. 200m Distance of monitor to receiver: 10m Receiver type: Residential Main source of noise: Traffic Result: COMPLIANT with modelling and mitigation measures implemented. Results were above predictions however works inaudible throughout monitoring. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
27/10/2024	11:03:00	Clyde MSF	Rosehill Stables	MSF051C_Northern Diversion Unwin Street	82.4	60	58.1	60.2	61	66.1	Monitoring Distance to source: 5m Distance of monitor to receiver: 5m Receiver type: Passive Recreation Main source of noise: Construction works - site works were the dominant noise source. Mitigation including noise blankets were observed to be effective, community notification and noise monitoring, works were below predictions .	Below or equal to the PNL
5/11/2024	11:45:00	Clyde MSF	Rosehill Stables	Unwin St Northern tie-in rock breaking (approved hours) MSF.09	82.9	60	55.2	57.8	67.6	81.6	Monitoring Distance to source: 20-30m. Distance of monitor to receiver: 5m Receiver type: Passive Recreation ATC Main source of noise: Site works audible as rockbreaking by 25t excavator. Results displayed LAeq 67.6d, which was below the PNL 82.9dba, by 15.3dba. mitigation measures included consultation with Receiver, noise blankets barrier, 3 to 1 respite periods, no works commencing until after 9am, noise monitoring and using the minimum plant feasible and reasonable to complete the works.	Below or equal to the PNL
5/11/2024	11:45:00	Clyde MSF	Rosehill Stables	Unwin St Northern Tie-in Rock breaking East stable (approved hours) MSF.09	86	60	46.3	50.3	61.9	74	Monitoring Distance to source: 20-25m. Distance of monitor to receiver: 8m. Receiver type: Passive Recreation ATC Main source of noise: site works audible as rockbreaking by a 25t excavator. Results were below PNL 86db by 24.1db. The works are compliant with mitigation measures including consultation with receiver, noise attenuation using the timber hoarding and atf noise blankets between works and receiver. Working respite of 3 to 1 and noise monitoring to confirm works.	Below or equal to the PNL
6/11/2024	11:15:00	Clyde MSF	Rosehill Stables	Northern Unwin St Realignment rock breaking & earthworks (approved hours) MSF.09	86	60	55.5	57.4	63.8	74	Monitoring Distance to source: 20m. Distance of monitor to receiver: 8m. Receiver type: Passive Recreation ATC Main source of noise: site works audible as rock breaking road pavement using a 25t excavator. Results displayed LAeq 63.8dba that works were considerably below the PNL 86db. Mitigation measures included consultation with receiver. Site hoarding, noise blankets, 3 to 1 respite, working during daytime hours and noise monitoring.	Below or equal to the PNL
6/11/2024	11:35:00	Clyde MSF	Rosehill Stables	Northern Unwin St Realignment Rock breaking and Earthworks (approved hours) MSF.09	82.9	60	56.4	58.3	62.8	81.5	Monitoring Distance to source: 20m to earthworks and 40m to rockbreaking. Distance of monitor to receiver: 5m. Receiver type: Passive Recreation ATC. Main source of noise: variable spikes produced from rockbreaking with a 25t excavator. Loading of concrete materials into truck using a 18t excavator and leaf vacuum vehicle from within ATC grounds. Results displayed LAeq 62.8dba, works were audible but considerably below the PNL 82.6dba . Mitigation measures in place to address the PNL included receiver consultation, noise monitoring, 3 to 1 respite, works undertaken behind noise blanket ATF, concrete barrier, a brick wall and timber hoarding.	Below or equal to the PNL
13/11/2024	4:36:00	Westmead	NCA02 - 123-129 Hawkesbury Rd	West_117 - Crane mobilisation	53.1	41	38.8	41.1	51.9	72.1	Monitoring distance to works 40m. Distance of monitor to receiver 10m. Dominant noise sources included crane movement, traffic along Hawkesbury Rd and non-project related vehicles. Works were audible for a portion of monitoring with a max LAeq of 54db <1 minute. Mitigation Measures included community consultation and noise monitoring. Observed reading was below the PNL.	Below or equal to the PNL

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
3/12/2024	20:08:00	Clyde MSF	Rosehill Stables	MSF086 - Utilities Sydney Water Potable Water Line - Water mains utilities service proving (Unwin St) & form work	71.8	60	54.1	56.1	67.7	95.6	Monitoring Distance to source: 250m. Distance of monitor to receiver: 10m Receiver type: recreational. Main source of noise: NDD truck Result: COMPLIANT and under PNL by 4.1 dBA largely due to local interference on local road. Mitigation measures implemented included community notification, installation of noise blankets on fencing atop jersey barriers, as well as timber hoarding already in place and noise monitoring.	Below or equal to the PNL
3/12/2024	22:15:00	Clyde MSF	Rosehill Stables	MSF086 - Utilities Sydney Water Potable Water Lien Stage 1 Water mains: NDD service proving	71.8	60	48	51	58.5	79.9	Monitoring Distance to source: 100m. Distance of monitor to receiver: 12m. Receiver type: recreational. Main source of noise: NDD truck. Results were below PNL by 13.3 dBA and below NML by 1.5 dBA. Mitigation measures included community notification, Noise blankets covering entire length of works area atop jersey barriers and noise monitoring.	Below or equal to the PNL
3/12/2024	22:50:00	Clyde MSF	61 Penelope Lucas Lane	MSF086 - Utilities Sydney Water Potable Water Line Stage 1 utilities: NDD service proving	51.6	50	35.2	39	43.7	70.1	Monitoring Distance to source: 270m. Distance of monitor to receiver: 15m on driveway. Receiver type: Residential Main source of noise: Road traffic. Results were below PNL and below NML by 6.3 dBA . Mitigation measures applied include community notification, noise blankets on jersey barriers adjacent to works and noise monitoring. Construction works were inaudible at monitoring location.	Below or equal to the PNL
4/12/2024	22:15:00	Parramatta	NCA03 330 Church Street, Parramatta	PARRA- 156 Spoil (sandstone) loadout from eastern box excavation	53.5	48	37	38.7	45.8	78.4	Distance to works: 400m North. Monitoring undertaken on 35th floor of Meriton Suites, window very slightly ajar (3mm) however enclosed building providing additional attenuation. Results displayed levels below PNL by 7.6 dBA and NML by 2.1 dBA, mitigation included community notification, noise monitoring and minimising acute dropping of spoil or contact with beams as noise mitigation measure; only constant engine noise audible.	Below or equal to the PNL
4/12/2024	22:50:00	Parramatta	45 Macquarie Street, Parramatta	PARRA- 156 Spoil (sandstone) loadout from eastern box excavation	54.5	48	39.8	41.2	45	78	Distance to works: 300m SW. Monitoring undertaken in common area on 24th Level; window awning open. Walls acting as noise attenuation. Results were 9.5 dBA below PNL and 3 dBA below NML. Train noise (track screeching and train passing) more audible than works when scheduled. mitigations measures in place include community notification, noise monitoring and minimising dropping of items as much as practicable onto nearby objects and opening and closing of bucket within shaft	Below or equal to the PNL
5/12/2024	14:35:00	Westmead	NCA02 - 123-129 Hawkesbury Road	Hawksbury X Priddle - Local Area Works	86	59	51.9	58.8	71.9	78.3	Monitoring distance to works 15m. Distance of monitor to receiver 5m. Main source of noise: Vacuum truck associated with Hawksbury x Priddle works. Vacuum truck was audible for a portion of the works and was the dominant noise source. Works were below the high noise impact threshold (75 dB) and below the predicted noise level (86 dB). Mitigation measures (noise blankets) were present however could be increased as they were only covering a portion of the works. Works are considered complaint with modelled predictions.	Below or equal to the PNL
9/12/2024	6:07:00	Westmead	NCA02 - 123-129 Hawkesbury Rd	OOHW_West 107 - concrete pump within acoustic shed.	42	37	44.2	46.7	56.4	77.8	Monitoring distance to works: Approx 40m. Distance of monitor to receiver 10m. Dominant noise sources included traffic along Hawkesbury Road and Bailey. Pedestrian gate in site were audible during lulls in traffic. Works were inaudible. Monitoring exceeded PNL as a result of non project related noise impacts. Observed LAeq level was a product of extraneous noise sources.	Exceeds the PNL
6/01/2025	23:02:00	Clyde MSF	Rosehill Stables	MSF089 Unwin St Realignment Works Stage 6 NDD service locating	79.7	60	46.4	51.7	54	79.7	Monitoring Distance to source: 100m. Distance of monitor to receiver: 10m. Receiver type: Recreational Main source of noise: NDD works results were below PNL and NML. Location of monitoring at the midway point between the stables where monitoring has been conducted for previous attended monitoring for Unwin St. Use of the high-pressure hose was not constant throughout the 15 minute period (only approximately 40-50% of the time) and reduction of local passing vehicles on the road reduced the LAeq considerably. Note that heavy showers occurred on the night of 6/01.	Below or equal to the PNL
7/01/2025	19:46:00	Clyde MSF	69 Penelope Lucas Lane, Granville	RH011 - Traffic island Reinstatement - removal and concrete breaking	59	54	52.7	55.3	58.3	75.2	Monitoring Distance to source: 300m. Distance of monitor to receiver: 12m. Receiver type: Residential Main source of noise: James Ruse Drive Traffic Results were below PNL and NML. Mitigation measures included community notification and noise monitoring. construction works were predominantly inaudible over the general traffic of James Ruse Drive	Below or equal to the PNL
7/01/2025	21:00:00	Clyde MSF	Rosehill Stables	RH011 - Traffic island Reinstatement Traffic island removal (hammering and concrete breaking)	78.7	60	51.9	55	60.8	78.9	Monitoring Distance to source: 400m Distance of monitor to receiver: 10m Receiver type: recreational Main source of noise: James ruse traffic Result were below PNL with mitigation measures implemented including non-continuous hammering, community notification and noise monitoring. Elevated readings throughout monitoring period due to inclement weather.	Below or equal to the PNL
7/01/2025	23:09:00	Clyde MSF	69 Penelope Lucas Lane, Granville	RH011 - Traffic island Reinstatement - Concrete breaking (excavator) and removal into tipper	58	50	41.6	44.3	48.5	64.1	Monitoring Distance to source: 300m. Distance of monitor to receiver: 12m. Receiver type: Residential Main source of noise: James Ruse Drive. Result were COMPLIANT and below PNL. Construction works inaudible. mitigation measures included community notification, noise monitoring and change of staging to prioritise traffic island removal and use of rock breaker during evening hours rather than at a later stage during the night shift.	Below or equal to the PNL

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
7/01/2025	23:36:00	Clyde MSF	6 A'Beckett St	MSF089 Unwin St Realignment Works - Concrete removal into tipper	52.5	50	40.6	43.6	48.9	70.4	Monitoring Distance to source: 300m. Distance of monitor to receiver: 7m. Receiver type: residential. Main source of noise: James Ruse traffic. Result were below PNL. Mitigation measures implemented include community notification, noise monitoring and prioritising hammering which is a louder activity during the evening period. Construction works largely inaudible throughout the monitoring period, with only 3 or 4 instances of the dropping of concrete audible (lasting 1 second each) but not discernible in monitor readings.	Below or equal to the PNL

Table 2.2 – Results of attended noise monitoring where the Noise Management Level (NML) is higher than or equal to the Predicted Noise Level (PNL)

Note: The last column presents the output from the Noise monitor following the completion of the monitoring event and is not a measure of compliance with the approval. Where there is an exceedance indicated, this finding should be read with the accompanying notes for the monitoring event, on account all exceedances were not attributed to construction activities alone.

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
5/08/2024	20:50:00	Clyde MSF	4 A'Becketts St	MSF068 Underbridge Drainage & MSF073 Creek Crossing	48	54	48.3	51.1	57.1	75.4	Monitoring Distance to source: 100m & 200m. Distance of monitor to receiver: 10m. Receiver type: Residential. Main source of noise: Traffic and aeroplanes. Works inaudible throughout monitoring. Observed LAeq level was a product of extraneous noise sources.	Above the NML
5/08/2024	22:20:00	Clyde MSF	NCA05 - 24 Hamilton St, Granville	MSF068 - Underbridge Drainage & MSF076 Deep Clean	39	49	48.4	51.8	57.6	71.8	Monitoring Distance to source: 200m. Distance of monitor to receiver: 5m. Receiver type: Residential. Main source of noise: m4 JRD traffic. Noted that nightworks on m4 overpass structure occurring, visible orange flashing lights, non-GLC related. Monitoring never fell below NML during the session. Works inaudible. Observed LAeq level was a product of extraneous noise sources.	Above the NML
6/08/2024	22:03:00	Clyde MSF	NCA01 - 24 Hamilton St, Granville	MSF068 Underbridge Drainage & MSF076 R2 Deep Clean	39	49	51	54.3	58.7	67.5	Monitoring Distance to source: 200m. Distance of monitor to receiver: 10m. Receiver type: residential. Main source of noise: traffic on the m4 overpass structures and JRD intersection. Works were inaudible throughout the monitoring and monitoring never came below the NML. Observed LAeq level was a product of extraneous noise sources.	Above the NML
15/08/2024	19:38:00	Parramatta	25 Smith St Parramatta	OOHW - Parra 125 - Nozzle Construction - Rock bolting	61	70	50.6	52.7	61.1	83.9	Distance from source: 50m horizontal then 20m vertical in box excavation. Distance from receiver: 5m. Main source of noise: construction works as rock hammering of nozzles in box. Works were audible intermittently throughout monitoring period. Works were slightly above NML 70dBA which was largely attributed to a passing bus. Mitigation measures include site hoarding in place, community notification and noise monitoring.	Below or equal to the NML
19/08/2024	20:32:00	Clyde MSF	69 Penelope Lucas Lane, Granville	MSF067 Delivery of Super-T Girders Stage 1 Crane setup	48	54	56.6	60.4	70	90.2	Monitoring Distance to source: 100m. Distance of monitor to receiver: 5m. Receiver type: residential. Main source of noise: traffic on JRD overpass and more dominant traffic on m4 slip road. Result: Noise monitoring never displayed a reading below PNL. Exceedances were often attributed to passing traffic. Notable that elevated traffic enhances due to echo of concrete overpass structure amplifying noise levels. Observed LAeq level was a product of extraneous noise sources and the surrounding acoustics of the monitoring location.	Above the NML
19/08/2024	23:55:00	Clyde MSF	69 Penelope Lucas Lane, Granville	MSF067 Delivery of Super-T Girders Stage 2 & 3 delivery and install	48	50	51.2	53.4	63.8	87.6	Monitoring Distance to source: 100m. Distance of monitor to receiver: 5m. Receiver type: Residential. Main source of noise: traffic dominant from JRD and M4 roads. Result: noise identified from work activities could not be isolated, continual traffic noise from JRD and M4 were the primary noise and the reason for exceedance of the NML. Observed LAeq level was a product of extraneous noise sources.	Above the NML
20/08/2024	20:05:00	Clyde MSF	69 Penelope Lucas Lane, Granville	MSF067 Delivery of Super-T Girders Stage 2 & 3	49	54	52	57.5	69.1	93.7	Monitoring Distance to source: 100m. Distance of monitor to receiver: 5m. Receiver type: Residential. Main source of noise: elevated readings from Traffic on JRD and M4 slip roads Result: majority of the monitoring period was recorded above NML due to traffic and reverb of concrete overpass. Quieter period of traffic works audible but below PNL and NML. Works where feasible were being undertaken behind physical barriers including noise blankets and large concrete structures and minimised. The primary noise source was source from extraneous sources. Monitoring was undertaken within 1.5m of metal hoarding due to safety risk monitoring adjacent to m4 slip road.	Above the NML

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
9/10/2024	20:04:00	Sydney Olympic Park	NCA_05 - 88 James Ruse Drive, Rosehill	CD078 Stage 2 Ring Construction	48.3	50	58.1	63.2	73.8	91.1	Monitoring Distance to source: 50m. Distance of monitor to receiver: 8m. Receiver type: residential. Main source of noise: heavy traffic on James Ruse Drive Mitigation measures implemented : works are below ground level within the dive structure. Noise was inaudible throughout the monitoring period, with noise readings never dropping below NML due to excessive traffic noise. Therefore, observed LAeq level was a product of extraneous noise sources.	Above the NML
14/10/2024	21:40:00	Clyde Dive	NCA_05 - 88 James Ruse Drive, Rosehill	CD078 LEM Operations	48.3	50	54.8	N/A	75.6	105.2	Monitoring Distance to source: 80m. Distance of monitor to receiver: 10m. Receiver type: residential. Main source of noise: traffic dominated. Mitigation measures implemented: noise igloo, minimal plant. Result: observed LAeq level was a product of extraneous noise sources.	Above the NML
28/08/2024	0:49:00	Clyde MSF	69 Penelope Lucas Lane, Granville	MSF067 - Stage 3 B	45	54	51.4	53.2	64	87.6	Monitoring Distance to source: 60m. Distance of monitor to receiver: 15m. Receiver type: residential. Main source of noise: traffic on JRD - works not audible. Result: Observed LAeq level was a product of extraneous noise sources.	Above the NML
28/08/2024	1:32:00	Clyde MSF	69 Penelope Lucas Lane, Granville	OOHWP MSF67 Stage 3b	49	54	50.2	N/A	60.7	82.9	Monitoring Distance to source: 60m. Distance of monitor to receiver: 15m. Receiver type: residential. Main source of noise: traffic on JRD - works not audible. Result: Observed LAeq level was a product of extraneous noise sources.	Above the NML
28/08/2024	2:10:00	Clyde MSF	69 Penelope Lucas Lane, Granville	OOWP MSF 067 STage 3b	49	54	50.4	N/A	64.9	84.5	Monitoring Distance to source: 60m. Distance of monitor to receiver: 15m. Receiver type: Residential. Main source of noise: traffic on JRD - works not audible. Result :Observed LAeq level was a product of extraneous noise sources.	Above the NML
16/09/2024	21:27:00	Sydney Olympic Park	Pullman Hotel	SOP17 Cross Passages - FRP Deliveries & Spoil Movements	55	70	49.6	51.2	54.1	70	Distance from source 70m. Distance from receiver 5m. Works were audible momentarily as a non-tonal (squawker) alarm within station box area. Dominant noise source was traffic and pedestrians on Herb Elliot Avenue. Works were below NML .	Below or equal to the NML
30/09/2024	21:25:00	Parramatta	45 Macquarie Street, Parramatta	PARRA123b - Nozzle Construction - Ground Support	43	58	50	N/A	68.5	95.4	Distance to Source 200m, distance to receiver 10m, works inaudible throughout monitoring period. Observed LAeq level was a product of extraneous noise sources.	Above the NML
1/10/2024	0:05:00	Parramatta	Nca03 - 119 Macquarie Street	PARRA123b - Nozzle Construction - Ground Support	49	56	46.5	N/A	58.2	95.4	Distance to source: 50m, distance to receiver: 10m, works audible as squawker only, elevated readings above NML. The observed LAeq level was a product of extraneous noise sources (naturally higher ambient noise levels from wind, animals, traffic).	Above the NML
1/10/2024	0:35:00	Parramatta	45 Macquarie Street, Parramatta	PARRA123b - Nozzle Construction - Ground Support	43	58	47.3	N/A	59	77.5	Distance to source: 200m, distance to receiver: 10m. Works inaudible throughout monitoring session. Observed LAeq level was a product of extraneous noise sources (naturally higher ambient noise levels from wind, animals, traffic).	Above the NML

Monitoring exceeded NMLs as a result of non-project related noise impacts.	Above the NML
12/12/2024	6:14:00	Westmead	NCA02 - 123-129 Hawkesbury Rd	OOHW_West 107 - concrete pump within acoustic shed.	42	42	42	45.4	63	94.2	Monitoring distance to works: Approx 40m. Distance of monitor to receiver 10m. Dominant noise sources included traffic along Hawkesbury Road and Bailey. Works were inaudible throughout duration of monitoring. Monitoring exceeded NMLs as a result of non-project related noise impacts.	Above the NML
17/12/2024	6:03:00	Westmead	10-12 Hassall Street, Westmead	No works (understanding of ambient noise of site when concrete works are not occurring).	42	42	44.7	47.1	56	72.3	Monitoring distance to acoustic shed: Approx 70m. Distance of monitor to receiver 5m. Dominant noise sources included traffic along Hassall Street and Alexandra Ave. Site hum and pedestrian gate in site were audible during lulls in traffic. Monitoring exceeded NMLs as a result of non project related noise impacts.	Above the NML
6/01/2025	20:17:00	Clyde MSF	69 Penelope Lucas Lane, Granville	Saw cutting for southern tie in of kerb and channel	50	54	46.7	51.4	55.6	74.4	Monitoring Distance to source: 300m. NW Distance of monitor to receiver: 10m. Receiver type: Residential. Main source of noise: James Ruse Drive traffic. Results Observed LAeq level was a product of extraneous noise sources.	Above the NML

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	Lmin	L90	LAeq	Lmax	Notes	Outcome
13/01/2025	19:29:00	Rosehill	Rosehill Gardens Stables	RH011 - traffic island reinstatement (Strip Klemmfix barriers and scabble under new kerbs)	43	60	49.9	51.5	59.5	81	Monitoring Distance to source: approx. 500m. Distance of monitor to receiver: 10m. Receiver type: Residential. Main source of noise: Non-project related road traffic on JRD. Works were inaudible throughout the duration of monitoring. Results were above NMLs as a result of non-project related noise impacts.	Below or equal to the NML
13/01/2025	22:40:00	Rosehill	Rosehill Gardens Stables	RH011 - traffic island reinstatement (Strip Klemmfix barriers and scabble under new kerbs)	43	60	49.6	50.7	60.3	79.5	Monitoring Distance to source: Approx. 200m. Distance of monitor to receiver: 10m. Receiver type: Recreational Main source of noise: Non-project related road traffic. Works were audible occasionally during lulls in traffic. Noise impacts from works were consistent with modelling. Results were slightly above NML as a result of non-project related noise impacts. Result: Observed LAeq level was a product of extraneous noise sources.	Above the NML
16/01/2025	20:12:00	Rosehill	Rosehill Gardens Stables	RH011	43	59	49.6	51.3	60.7	84.8	Monitoring Distance to source: Approx. 200m. Distance of monitor to receiver: 10m. Receiver type: Recreational. Main source of noise: Non-project related road traffic. Works were audible occasionally during lulls in traffic. Noise impacts from works were consistent with modelling. Results were slightly above NML as a result of non-project related noise impacts.	Above the NML

Table 2.3 – Results of Ground borne noise monitoring

Note: Where there is an exceedance indicated, this finding should be read with the accompanying notes for the monitoring event, on account all exceedances were not attributed to construction activities alone. Note – PNL = Predicted Airborne Noise levels and NML = GB Noise levels as indicated by the DNVIS.

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	L_{Aeq}	Notes
22/07/2024	10:15:00	Westmead	NCA-2 13-17 Bailey Street	WM.17a (Box Excavation with Hammering), WM.18 Mined Tunnel Excavation & WM.19 (Deliveries & Spoil Haulage)	55	45	43	GBN MONITORING EVENT Monitoring event focused on capturing rock hammering activities in Zone 1 & Zone 2 of Station Box. Monitoring was undertaken within the bedroom of an apartment building on the second story of 13-17 Bailey Street approx. 100m from the hammering activities. Construction activities at the time of monitoring including spoil load out, water cart operations, haulage trucks arriving to site and rock hammering. GLC Construction noise was inaudible throughout the duration of the monitoring period. The dominant noise source was children and activities within the residential apartment block. Works were observed to be below the NML and PNL.
15/08/2024	14:10:00	Westmead	32A Alexandra Avenue	Rock breaking cross passage	62	45	36.3	GBN MONITORING EVENT Monitoring event focused on capturing rock hammering activities in the cross passage of the stub tunnels Monitoring from source = 31m (slant distance to cross passage). Monitoring from Receiver = within living room of receiver. Dominant noise source was clock within dwelling. Construction activities during the monitoring event included rock hammering within the cross passage and use of 400T crane to demobilise plant. Only rock hammering was audible, which were audible for the majority of the monitoring event. Works were observed to be below the NML and PNL.
31/10/2024	10:20:00	SOP	1 Showground Rd, Royal Agriculture Society	None - background only	68	45	36.6	GBN MONITORING EVENT: Background monitoring prior to cross passage construction taking place. Monitoring within office building. Works were observed to be below the NML and PNL.
11/11/2024	13:00:00	SOP	1 Showground Rd, Royal Agriculture Society	Cross Passage XP55 - Rock Breaking	68	45	36.6	GBN MONITORING EVENT: Distance from works location: 36m underground. Dominant noise source: local interference from external sources including pedestrians, leaf blower and noises from surrounding rooms. Results were below PNL and NML therefore no further mitigation measures required.

Table 2.4 – Results of other attended noise monitoring

Note: Where there is an exceedance indicated, this finding should be read with the accompanying notes for the monitoring event, on account all exceedances were not attributed to construction activities alone.

Date	Time	Site	Monitoring Location	Construction Activity	PNL	NML	L_{Aeq}	Notes
25/07/2024	23:26:00	Sydney Olympic Park	2D Figtree Drive	TBM Dismantling & Retrieval Works	50.8	51	51	**Attended Monitoring for Complainant 5734:** Monitoring completed on balcony of apartment looking over site. Distance to source: 350m. Low background noise being experienced with minimal traffic, trains and activities within the Entertainment Precinct. Recorded wheel squeal/grinding from trains immediately following monitoring event at 58.3dB. Dominant noise sources from construction works were squawker from telehandler, scaffolding dismantling works and dropped metal objects. Observed values were generally consistent with the NML.
25/07/2024	23:45:00	Sydney Olympic Park	2D Figtree Drive	TBM Dismantling works including scaffolding removal	50.8	51	32.1	**Attended Monitoring for Complainant 5734**: Monitoring completed within bedroom of apartment that overlooks site. Glass doors to outside areas were closed. Distance to source: 350m. Low background noise from within the apartment being experienced including the operating washing machine, running water and air conditioning within apartment heard. Noise sources from construction works were faintly and only intermittently heard behind closed glass doors including squawker from telehandler, scaffolding dismantling works and dropped metal objects. Observed results were below NML.

Daily Notes

Date and time	By	Monitoring Point(s)	Note
13 Sep 2024	Daniel		VIB0057 Monitor mobilized for Heritage - RTA Depot at Clyde MSF (West)
28 Sep 2024	Daniel		Vibration device in the site office - DOES NOT REFLECT CONSTRUCTION VIBRATION ACTIVITIES
29 Sep 2024	Daniel		Vibration device in the site office - DOES NOT REFLECT CONSTRUCTION VIBRATION ACTIVITIES
30 Sep 2024	Daniel		ATC Stables South - Vibration device in the site office - DOES NOT REFLECT CONSTRUCTION VIBRATION ACTIVITIES
30 Sep 2024	Daniel		Small spike readings for Heritage RTA Depot related to individual pumping water into the WTP pipeline adjacent to the monitor for dewatering due to rainfall
02 Oct 2024	Daniel		Heritage RTA Depot vibration monitor reinstalled and repositioned to south curtilage of the RTA Depot
02 Oct 2024	Daniel		Device inspected at 12:45pm - 13:02pm to identify why it appeared offline. device displayed no signal light. Device moved to try to improve signal
11 Oct 2024	Daniel		VIB000126 installed at the ATC. placement of the sandbag on top and walking around monitor between 11-12
11 Oct 2024	Daniel		VIB0057 relocated to the corner of the RTA after rockcxbreaking of floo d basin area, in preparation for road diversion
11 Oct 2024	Daniel		Rock breaking undertaken on the 9-10th October, Had not received approved access to ATC stables to install vibration monitor. Some minor rock breaking still be undertaken by 18T excavator approximately 15-20m from Receiver Horse Stable

Daily Notes

Date and time	By	Monitoring Point(s)	Note
21 Oct 2024	Kellie		Rainfall recorded in rain gauge over the weekend period = 4.5mm
25 Oct 2024	Kellie		Rainfall recorded in site gauge @8:30am = 3mm
01 Nov 2024	Kellie		Daily rainfall recorded at 7:38am = 2.5mm
04 Nov 2024	Kellie		No works on-site - RDO
08 Nov 2024	Kellie		Rainfall in site gauge from overnight falls = 7.5mm
18 Nov 2024	Kellie		Rainfall recorded in site gauge at 7:35am = 21.5mm
28 Nov 2024	Kellie		Site rainfall recorded in gauge at 9:20am = 5mm
29 Nov 2024	Hala		rain gauge reading ~2mm
03 Dec 2024	Hala		rain gauge reading is ~ 14.5mm over the weekend and Monday (RDO)
09 Dec 2024	Hala		rainfall over the weekend ~15.5mm.
18 Dec 2024	Hala		rain gauge reading is ~5mm
06 Jan 2025	Hala		rain gauge reading after the Christmas shutdown is ~ 1mm.
07 Jan 2025	Hala		rain gauge reading is ~ 13mm.
09 Jan 2025	Hala		rain gauge reading ~ 26.5mm.
13 Jan 2025	Hala		rain gauge reading over Friday and the weekend is ~ 25.5mm.
16 Jan 2025	Hala		rain gauge reading is ~ 25mm

Vibration Explained Events

Time	Rule	Values	Monitoring	Category	Event Notes
Wed, 24 Jul 2024					
04:56 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	70.082	218 Church Street	**NR** Monitor knocked	monitor knocked by worker
Thu, 25 Jul 2024					
10:34 AM - 10:35 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.869, 5.083	240 Church Street Parramatta	**NR** Concrete Breaking Works	concrete slab breaking works threshold for cosmetic damage was not exceeded
03:11 PM - 03:17 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	471.18, 203.711	218 Church Street	**NR** Monitor knocked	monitor knocked by worker
Fri, 26 Jul 2024					
09:23 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	178.41	218 Church Street	**NR** Monitor displaced	relocation of vibration monitor

Time	Rule	Values	Monitoring	Category	Event Notes
Mon, 29 Jul 2024					
08:09 AM - 08:21 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.962, 5.098	218 Church Street	**NR** Working in close proximity to monitor	OzCut coring concrete in close proximity to the monitor.
09:29 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	585.466	218 Church Street	**NR** Monitor displaced	Monitor moved further from the coring works location
10:31 AM - 10:53 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.518, 9.117, 5.017	218 Church Street	**NR** Working in close proximity to monitor	concrete coring works are taking place in close proximity to the monitor
01:31 PM - 02:44 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	18.74, 7.141, 14.727, 14.774, 5.472, 13.564, 6.123, 5.462, 5.67, 5.438	218 Church Street		concrete coring rig drilling in close proximity to the monitor. Cosmetic damage criteria were not triggered
Tue, 30 Jul 2024					
07:55 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	35.71	218 Church Street	**NR** Working in close proximity to monitor	concrete coring taking place in close proximity to the monitor
08:16 AM - 09:44 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	7.163, 6.751, 5.435, 5.591, 6.027, 6.583, 7.242, 5.819, 7.6, 6.268, 5.631, 6.193, 7.047, 6.104, 5.502, 89.457, 26.667	218 Church Street	**NR** Working in close proximity to monitor	Concrete coring works are taking place in close proximity to monitor. Criteria for cosmetic damage were not exceeded.

Time	Rule	Values	Monitoring	Category	Event Notes
Thu, 01 Aug 2024					
07:07 AM - 09:39 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.538, 45.187, 54.908, 27.877, 23.667, 59.142, 7.858, 8.647, 93.532, 153.021, 5.928, 35.877, 13.204, 25.463, 69.458, 8.228, 931.75	218 Church Street	**NR** Working in close proximity to monitor	excavator working right next to the monitor. monitor was moved away from the excavator work area.
12:08 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	344.754	240 Church Street Parramatta	**NR** Monitor knocked	monitor knocked by a worker
Fri, 02 Aug 2024					
11:24 AM - 03:49 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.053, 8.109, 8.088	218 Church Street		Concrete breaking works using a hydraulic hammer. Cosmetic damage criteria weren't triggered.
Sat, 03 Aug 2024					
08:11 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	8.191	218 Church Street	**NR** Concrete Breaking Works	hydraulic hammer used to break concrete. recorded event is below cosmetic damage criteria.
Mon, 05 Aug 2024					
01:20 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	11.307	218 Church Street	**NR** Working in close proximity to monitor	no vibration intensive works took place during the time of the event. Vibration resulted from workers movement in close proximity to monitor.

Time	Rule	Values	Monitoring	Category	Event Notes
Tue, 06 Aug 2024					
03:57 PM - 05:16 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	188.867, 156.445, 7.769, 5.408, 52.99, 15.238, 149.135, 12.697, 19.563, 6.105, 94.889, 36.199, 13.708, 20.72, 30.739, 10.118, 84.903	218 Church Street	**NR** Working in close proximity to monitor	no vibration intensive works were taking place during the time of the events. Workers were actively moving items close to the monitor, resulting in the recorded exceedances.
Wed, 07 Aug 2024					
03:03 AM - 03:47 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	81.568, 14.495	218 Church Street	**NR** Monitor knocked	materials placed next to the monitor
03:49 PM - 03:58 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.768, 15.437, 6.081	240 Church Street Parramatta		excavator working and evening fill material in close proximity to monitor. No vibration intensive works were taking place.
Fri, 09 Aug 2024					
02:01 PM - 02:02 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	90.641, 26.075	Roxy Theatre	**NR** Installation	Monitor reinstalled
Mon, 19 Aug 2024					
09:21 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	60.865	Roxy Theatre	**NR** Monitor knocked	Removing battery for charging as device was showing offline. No vibration-intensive activities being completed at time
Thu, 22 Aug 2024					
01:03 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	12.123	Roxy Theatre	**NR** Monitor knocked	worker placed something on the top of the monitor's box

Time	Rule	Values	Monitoring	Category	Event Notes
Tue, 03 Sep 2024					
04:06 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	420.151	Roxy Theatre	**NR** Monitor knocked	Surveyors working in the immediate area have made contact with the monitoring device.
Sat, 14 Sep 2024					
11:16 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	18.627	Roxy Theatre	**NR** Monitor knocked	Labourers in the area moving vac truck hose for fish tanks have bumped the monitoring device.
Sat, 21 Sep 2024					
08:33 AM - 12:28 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.424, 5.819	Roxy Theatre	**NR** Monitor knocked	Personnel moving in vicinity of the monitor. No vibration-intensive activities being completed on-site with shot-creting of the nozzles being undertaken.
Mon, 30 Sep 2024					
11:28 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	15.363	240 Church Street Parramatta	**NR** Monitor displaced	Site team inspecting scaffolding behind container wall and have bumped monitor inadvertently. No vibration intensive activities being completed at the time of the event.
Tue, 01 Oct 2024					
01:16 AM - 07:47 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	6.166, 7.127	Roxy Theatre	**NR** Human movement	monitor knocked by worker movement.
07:47 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	7.127	Roxy Theatre	**NR** Monitor knocked	monitor knocked by worker

Time	Rule	Values	Monitoring	Category	Event Notes
Wed, 09 Oct 2024					
09:20 AM - 09:21 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	237.5, 230.898	Roxy Theatre	**NR** Monitor knocked	monitor being checked
Thu, 10 Oct 2024					
10:41 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	271.281	Roxy Theatre	**NR** Monitor displaced	monitor being troubleshooted.
Fri, 11 Oct 2024					
04:10 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	144.275	Roxy Theatre	**NR** Monitor displaced	Monitor displaced during checks being completed for connectivity. Monitor reinstated. Alert not related to GLC works.
07:03 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	10.701	Roxy Theatre	**NR** Monitor knocked	Electricians working in area to reinstall lighting and have made contact with the monitor. Alert not related to GLC works.
Mon, 14 Oct 2024					
03:06 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	10.512	Roxy Theatre	**NR** Human movement	Labourers replacing matting and cleaning up the area around the monitor. No vibration intensive activities being completed at the time of this event.

Daily Notes

Date and time	By	Note
26 Jul 2024	Hala	rain gauge reading ~ 6mm
27 Jul 2024	Hala	Adjacent project, 197 Church Street were rock hammering at ~ 7:30am
29 Jul 2024	Hala	Rain gauge reading ~9.5mm
05 Aug 2024	Kellie	0.5mm of rainfall noted in rain gauge following weekend
12 Aug 2024	Kellie	Rainfall of 1mm recorded in site gauge
13 Aug 2024	Kellie	Rainfall recorded in rain gauge at 8am = 1.5mm
15 Aug 2024	Hala	Rain gauge reading ~5.5mm
19 Aug 2024	Kellie	Site rainfall for weekend recorded = 1.5mm
29 Aug 2024	Hala	moderate winds between 15 to 25 Km/hr and moderate bush fires warning causing dust to be generated. Site surface has been sprayed and swept throughout the day and misters have been functional down in the box.
26 Sep 2024	Kellie	Site rainfall gauge at 6:30am = 6mm
27 Sep 2024	Kellie	Daily rainfall recorded in on-site gauge at 7:45am = 41mm
30 Sep 2024	Kellie	9.5mm of rainfall over the weekend in gauge @7:41am
03 Oct 2024	Hala	Rain gauge reading from yesterday's rainfall is ~4mm.
11 Oct 2024	Kellie	Rainfall recorded in site gauge @9:42am = 2.5mm
14 Oct 2024	Kellie	Rainfall recorded in site gauge @9:00am = 1mm
15 Oct 2024	Kellie	Overnight rainfall in site gauge @6:40am = 8mm
16 Oct 2024	Hala	rain gauge reading ~3mm.
18 Oct 2024	Kellie	Rainfall recorded in site rain gauge at 3:12pm = 1.5mm

07:10 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	74.231	Roxy Theatre	**NR** Battery Check	battery being recharged

Daily Notes

Date and time	By	Monitoring Point(s)	Note
21 Oct 2024	Kellie		Rainfall recorded in rain gauge over the weekend period = 4.5mm
25 Oct 2024	Kellie		Rainfall recorded in site gauge @8:30am = 3mm
01 Nov 2024	Kellie		Daily rainfall recorded at 7:38am = 2.5mm
04 Nov 2024	Kellie		No works on-site - RDO
08 Nov 2024	Kellie		Rainfall in site gauge from overnight falls = 7.5mm
18 Nov 2024	Kellie		Rainfall recorded in site gauge at 7:35am = 21.5mm
28 Nov 2024	Kellie		Site rainfall recorded in gauge at 9:20am = 5mm
29 Nov 2024	Hala		rain gauge reading ~2mm
03 Dec 2024	Hala		rain gauge reading is ~ 14.5mm over the weekend and Monday (RDO)
09 Dec 2024	Hala		rainfall over the weekend ~15.5mm.
18 Dec 2024	Hala		rain gauge reading is ~5mm
06 Jan 2025	Hala		rain gauge reading after the Christmas shutdown is ~ 1mm.
07 Jan 2025	Hala		rain gauge reading is ~ 13mm.
09 Jan 2025	Hala		rain gauge reading ~ 26.5mm.
13 Jan 2025	Hala		rain gauge reading over Friday and the weekend is ~ 25.5mm.
16 Jan 2025	Hala		rain gauge reading is ~ 25mm

Vibration Explained Events

Time	Rule	Values	Monitoring	Category	Event Notes
Sun, 21 Jul 2024					
06:05 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	52.136	13 - 17 Bailey St	**NR** Non GLC related	No GLC works were occurring on the day of the exceedance
Wed, 24 Jul 2024					
08:05 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.083	10 - 12 Hassall St		GLC were working at the time of the exceedance, however no rock breaking activities had commenced. Exceedance is likely a result continuous vibrations that are currently being recorded by the device and are not a result of GLC.
01:06 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	11.33	13 - 17 Bailey St	**NR** Human Interaction	No works were being undertaken at the time of the exceedance (lunch break) - exceedance was likely a result of interference from apartment residents.
Fri, 26 Jul 2024					
09:16 AM - 09:17 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	551.313, 65.433	Hassall Street	**NR** Human Interaction	GLC staff knocked device while re-instating noise monitoring device.
Sat, 27 Jul 2024					
05:59 PM - 06:00 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	847.996, 133.672	13 - 17 Bailey St	**NR** Human Interaction	No GLC works occurring at the time of the exceedances - disturbed by apartment residents.

Time	Rule	Values	Monitoring	Category	Event Notes
Sun, 28 Jul 2024					
04:10 PM - 06:14 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	8.519, 61.231, 72.718, 19.67, 353.463, 21.952, 38.735, 16.525, 18.051, 33.654	13 - 17 Bailey St	**NR** Non GLC related	No GLC works occurring on day of exceedance.
Mon, 29 Jul 2024					
12:38 PM - 12:41 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	38.264, 44.823	13 - 17 Bailey St	**NR** Non GLC related	No GLC works at the time of exceedance (lunch break) - not considered GLC related.
12:45 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	23.157	Hassall Street	**NR** Human Interaction	GLC staff replaced silt sock over device.
02:45 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	21.472	Hassall Street	**NR** Human Interaction	Device was bumped during GLC, Metro and ER environmental inspection - not work related.
04:57 PM - 05:15 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	80.267, 29.024, 26.462, 7.074	13 - 17 Bailey St	**NR** Human Interaction	No GLC works occurring at the time of the exceedance (transition between day and night shifts) exceedance was a result of human interaction.
Tue, 30 Jul 2024					
04:45 PM - 04:49 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.309, 36.689	13 - 17 Bailey St	**NR** NR - Non GLC related	No GLC works being undertaken during time of exceedance (shift rotation).

Time	Rule	Values	Monitoring	Category	Event Notes
Wed, 31 Jul 2024					
09:04 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.954	Hassall Street	**NR** Equipment installation	Re-instated sediment sock over device.
05:19 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	14.68	13 - 17 Bailey St	**NR** NR - Non GLC related	No GLC works occurring at the time of exceedance (shift rotation).
Thu, 01 Aug 2024					
05:00 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	11.775	13 - 17 Bailey St		No GLC works at time of exceedance - shift change.
Fri, 02 Aug 2024					
05:28 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	6.222	13 - 17 Bailey St		No GLC works at time of exceedance - shift change.
06:13 PM - 06:31 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	13.269, 5.537	13 - 17 Bailey St		No vibration intensive GLC works being undertaken at the time of exceedance - likely a result of car parking adjacent device.
Sat, 03 Aug 2024					
01:13 PM - 02:48 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	11.922, 8.33	13 - 17 Bailey St	**NR** Non GLC related	No GLC works occurring at time of exceedance
Sun, 04 Aug 2024					
05:20 PM - 06:15 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	43.667, 409.451, 24.011, 23.865	13 - 17 Bailey St	**NR** Non GLC related	No GLC works occurring on day of exceedances.

Time	Rule	Values	Monitoring	Category	Event Notes
Tue, 06 Aug 2024					
04:46 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	7.845	13 - 17 Bailey St		shift change - no works occurring at time of exceedance.
05:16 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	49.144	13 - 17 Bailey St	**NR** Non GLC related	shift change - no works occurring at time of exceedance.
05:53 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	25.73	13 - 17 Bailey St		No vibration intensive GLC works being undertaken at the time of exceedance - likely a result of car parking adjacent device.
Wed, 07 Aug 2024					
04:46 PM - 05:17 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	11.199, 8.615	13 - 17 Bailey St		None GLC - no works were being undertaken at the time of exceedance (shift change)
Thu, 08 Aug 2024					
04:13 PM - 04:18 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	45.886, 345.817	13 - 17 Bailey St		No vibration works being undertaken at the time of exceedance - non glc related.
04:42 PM - 04:59 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.248, 227.319	13 - 17 Bailey St		No GLC works being undertaken at the time of exceedance - shift change.
Fri, 09 Aug 2024					
05:39 PM - 05:40 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	206.229, 17.101	13 - 17 Bailey St		Non GLC related - shift change, no works occuring
Mon, 12 Aug 2024					
05:05 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	19.597	13 - 17 Bailey St	**NR** Non GLC related	Non GLC related - no works undertaken, shift change

Time	Rule	Values	Monitoring	Category	Event Notes
Thu, 15 Aug 2024					
04:31 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	12.196	13 - 17 Bailey St	**NR** Non GLC related	No GLC works were occurring at the time of the exceedance.
Mon, 26 Aug 2024					
11:18 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	6.509	10 - 12 Hassall St	**NR** Non GLC related	No vibration intensive works being undertaken at the time of the exceedance (spoil load out only) - exceedance due to devices being bumped in carpark.
Tue, 03 Sep 2024					
08:32 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.284	10 - 12 Hassall St	**NR** Non GLC related	No GLC works were being undertaken at the time of the exceedance (Westmead photo in tunnel was being undertaken).
Wed, 04 Sep 2024					
01:11 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.16	13 - 17 Bailey St		Exceedance occurred during site lunch break - no works were being undertaken.
Sat, 07 Sep 2024					
04:27 PM - 04:54 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	101.4, 11.792	13 - 17 Bailey St	**NR** Non GLC related	No GLC works were being undertaken at the time of the exceedance
Sun, 08 Sep 2024					
04:08 PM - 05:58 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	116.821, 6.785	13 - 17 Bailey St	**NR** Non GLC related	No GLC works were being undertaken at the time of the exceedance

Time	Rule	Values	Monitoring	Category	Event Notes
Wed, 11 Sep 2024					
12:24 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	15.339	13 - 17 Bailey St	**NR** NR - Non GLC related	No GLC works were being undertaken at the time of the exceedance (lunch). Checked on device straight after exceedance and noted that a car was parked immediately adjacent the device, which likely caused exceedance.
05:58 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	9.876	13 - 17 Bailey St		No GLC works were being undertaken at the time of the exceedance (night shift pre-start).
08:34 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	33.373	13 - 17 Bailey St	**NR** Non GLC related	Confirmed with night shift supervisor, no vibration intensive works were being undertaken at the time of the event (spoil movement only). Checked on device following morning and noted that container lid was off. Assumed to be non-GLC related disturbance to device.
Sat, 14 Sep 2024					
04:45 PM - 04:46 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	187.246, 70.569	13 - 17 Bailey St	**NR** NR - Non GLC related	Non GLC staff were on site at the time of the exceedance (Saturday afternoon), exceedance is non GLC related.
04:47 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	384.505	13 - 17 Bailey St		Non GLC staff were on site at the time of the exceedance (Saturday afternoon), exceedance is non GLC related.

Time	Rule	Values	Monitoring	Category	Event Notes
Thu, 19 Sep 2024					
02:09 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	129.068	13 - 17 Bailey St	**NR** Non GLC related	GLC were undertaking works at the time of the exceedance (breaking in box). Upon inspecting, a car was parked very close to the device and likely caused the exceedance.
Sun, 22 Sep 2024					
06:42 PM - 06:44 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	13.124, 201.202	13 - 17 Bailey St	**NR** Non GLC related	No GLC works were being undertaken at the time of the exceedance
Wed, 25 Sep 2024					
01:18 PM - 01:19 PM	**Third Party Vibration Threshold** 5.00 mm/s vSum	14.906, 11.264	13 - 17 Bailey St		No vibration intensive works were being undertaken at the time of the exceedance (Lunch break). No considered to be GLC related.
Thu, 03 Oct 2024					
12:33 AM - 12:39 AM	**Third Party Vibration Threshold** 5.00 mm/s vSum	5.326, 6.032, 5.68	32A Alexandra Ave		Confirmed with night shift supervisor, no vibration intensive works being undertaken at the time of the exceedance. No works were being undertaken in the stub tunnels at the time. Works are considered to be non-GLC related.

Daily Notes

Date and time	By	Monitoring Point(s)	Note
26 Jul 2024	Lochlan		7mm of rain overnight
29 Jul 2024	Lochlan		9mm of rain over weekend (27-29th July).
14 Aug 2024	Lochlan		4mm of rain recorded at 2pm
26 Sep 2024	Lochlan		9mm of rain recorded overnight
15 Oct 2024	Lochlan		7mm rain recorded overnight

Approved Signatory : For Juan Aguero

Clause and Characteristic Tested	Result	Clause and Characteristic Tested	Result
12: Acoustical Sig. tests of a frequency weighting	*Pass*	17: Level linearity incl. the level range control	*N/A*
13: Electrical Sig. tests of frequency weightings	*Pass*	18: Toneburst response	*Pass*
14: Frequency and time weightings at 1 kHz	*Pass*	19: C Weighted Peak Sound Level	*Pass*
15: Long Term Stability	*Pass*	20: Overload Indication	*Pass*
16: Level linearity on the reference level range	*Pass*	21: High Level Stability	*Pass*

The sound level meter submitted for testing has successfully completed the class 1 periodic tests of IEC 61672-3:2013, for the environmental conditions under which the tests were performed.

As public evidence was available, from an independent testing organisation responsible for approving the results of pattern evaluation test performed in accordance with IEC 61672-2:2013, to demonstrate that the model of sound level meter fully conformed to the requirements in IEC 61672-1:2013, the sound level meter submitted for testing conforms to the class 1 requirements of IEC 61672-1:2013.

Uncertainties of Measurement -

Acoustic Tests		Environmental Conditions	
125Hz	*±0.13 dB*	*Temperature*	*±0.1 °C*
1kHz	*±0.13 dB*	*Relative Humidity*	*±1.9 %*
8kHz	*±0.14 dB*	*Barometric Pressure*	*±0.11 kPa*
Electrical Tests	*±0.13 dB*		

All uncertainties are derived at the 95% confidence level with a coverage factor of 2.

NATA
WORLD RECOGNISED ACCREDITATION

This calibration certificate is to be read in conjunction with the calibration test report.

Acoustic Research Labs Pty Ltd is NATA Accredited Laboratory Number 14172.
Accredited for compliance with ISO/IEC 17025 - Calibration.

The results of the tests, calibrations and/or measurements included in this document are traceable to SI units.

NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration and inspection reports.

Total Distortion	*Pass*

Nominal Level	Nominal Frequency	Measured Level	Measured Frequency
94	1000	94.05	1000.00

The sound calibrator has been shown to conform to the class 1 requirements for periodic testing, described in Annex B of IEC 60942:2017 for the sound pressure level(s) and frequency(ies) stated, for the environmental conditions under which the tests were performed..

Uncertainties of Measurement -

Specific Tests		Environmental Conditions	
Generated SPL	*±0.10 dB*	*Temperature*	*±0.1 °C*
Frequency	*±0.07 %*	*Relative Humidity*	*±1.9 %*
Distortion	*±0.20 %*	*Barometric Pressure*	*±0.11 kPa*

All uncertainties are derived at the 95% confidence level with a coverage factor of 2.

Calibration report

Certificate of Calibration

Certificate number: 20240603766967738969

Calibration results after measurement

Axis	Frequency	Reference measurement Vref (Vref*weighting(f))	Excitation measurement of the device Vmeas	Deviation 100 X (Vmeas-Vref)/ Vref	Result
X	16.0	9.42	9.32	-1.02	PASS
Y	16.0	9.40	9.32	-0.85	PASS
Z	16.0	9.38	9.28	-1.15	PASS

Name: LECIYE

Date of calibration*: 2024-06-03 (YYYY-MM-DD)

* Recommended calibration interval is 24 months from first day of use, unless otherwise required by local standards and/or local laws.

Hexanode Calibration Certificate

27 Oct 2023

Thank you for choosing SiteHive for your realtime environmental management. This calibration certificate is valid for the device below.

Noise

The Hexanode sound level meter has been pressure calibrated by SiteHive using a NATA Certified (IEC 60942: Sound calibrators) Sound Level Calibrator, at 2 Foveaux Street, Surry Hills, NSW, 2010.

Serial Number	Calibration Date	Calibration Value
HEX-000025	25 Mar 2022	3.044515

Accuracy:	Complies with precision requirements of IEC 61672 for Class 2
Acoustic overload point:	135 dBSPL
Frequency Range:	20 Hz ~ 12.5 kHz
Frequency Rating:	Z, A and C weighting
Parameters (dB):	Frequency & time weighted integrations, statistical levels, and more
Direction of Arrival:	Device angle & cartesian angle (0°-360°) of dominant noise source

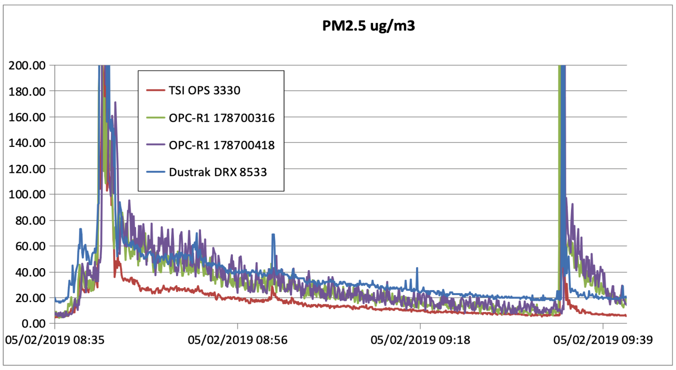
The SiteHive Hexanode uses innovative digital MEMS microphones, and as such cannot achieve full pattern approval in line with international standard IEC 61672, which is written for analogue condenser microphones. However, the SiteHive Hexanode sound level meter has been rigorously tested by the the National Measurement Institute (NMI), the division of the Australian Federal Government Department of Industry, Science, Energy & Resources responsible for providing world-class measurement services to support a fair, safe, healthy and competitive Australia. The National Measurement Institute's (NMI) acoustic, ultrasound and vibration measurement services are the most accurate in Australia, and include providing the certification for NATA (National Association of Testing Authorities) testing facilities, who provide class certification for noise meters. NMI undertook all of the possible tests outlined in IEC 61672-2, with the Hexanode passing all precision requirements within the criteria of a class 2 device.

Dust

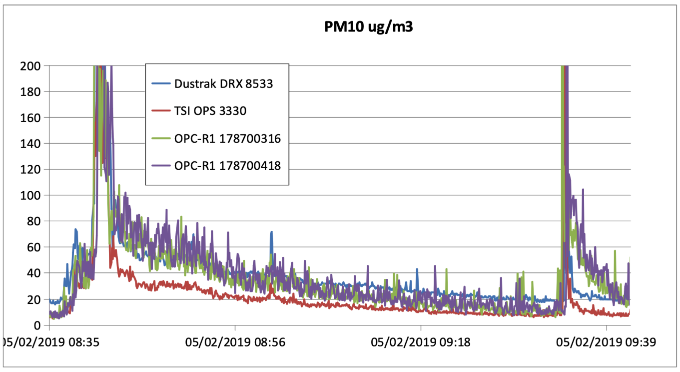
The Hexanode utilises the Alphasense R2 Optical Particle Sensor, to provide real-time dust measurements. Whilst the R2 does not have any gravimetric sampling capabilities, measurements can be adjusted using a K-Factor if one is available. SiteHive software will also provide measurements from the nearest Government air quality station for reference. The full data sheet for the Alphasense R2 is available here.

Particle range	µm spherical equivalent size (based on RI of 1.5)	0.30 to 12.4
Size categorisation	Number of software bins	16
Sampling interval	Histogram period (seconds)	2 to 30
Total flow rate	L/min (typical)	0.24
Max particle count rate	particles/second	10,000
Max coincidence probability	% concentration at 10^6 particles/L	0.7

Prior to deployment, the R2 is tested against TSI Optical Particle Sizer 3330 and DustTrak instruments.



Comparison of PM2.5 monitoring by OPC-R2 sensor and TSI OPS 3330 and DustTrak instruments. All are set at 5s averaging and are sampling the ambient air of a workshop, the raw 3330 data has been used to calculate a PM figure.



Comparison of PM10 monitoring by OPC-R2 sensor and TSI OPS 3330 and DustTrak instruments. All are set at 5s averaging and are sampling the ambient air of a workshop, the raw 3330 data has been used to calculate a PM figure.

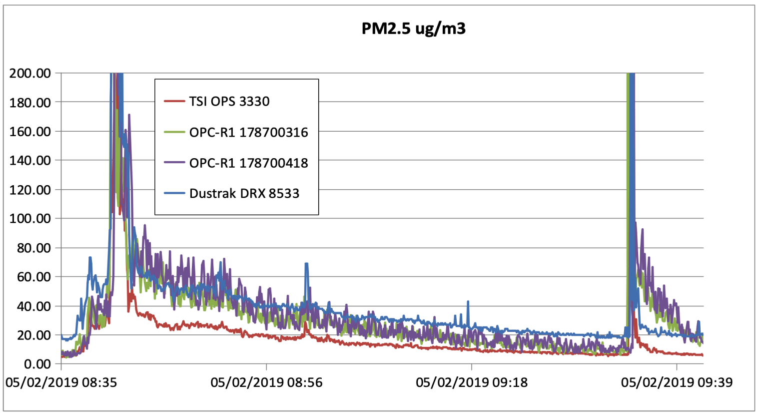
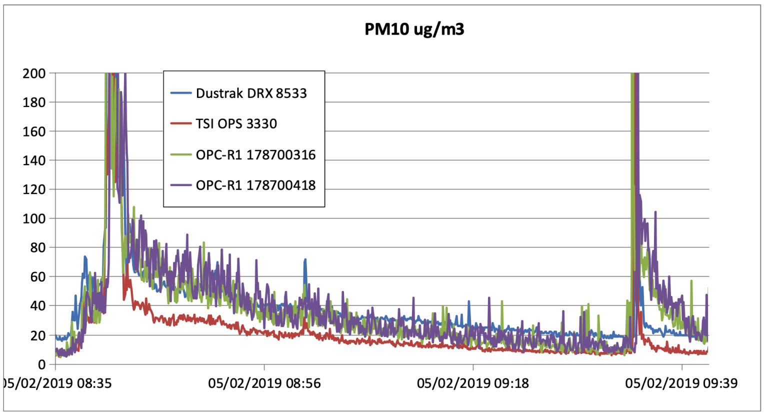
Particle range	μm spherical equivalent size (based on RI of 1.5)	0.30 to 12.4
Size categorisation	Number of software bins	16
Sampling interval	Histogram period (seconds)	2 to 30
Total flow rate	L/min (typical)	0.24
Max particle count rate	particles/second	10,000
Max coincidence probability	% concentration at 10^6 particles/L	0.7

Prior to deployment, the R2 is tested against TSI Optical Particle Sizer 3330 and DustTrak instruments.



Comparison of PM2.5 monitoring by OPC-R2 sensor and TSI OPS 3330 and DustTrak instruments. All are set at 5s averaging and are sampling the ambient air of a workshop, the raw 3330 data has been used to calculate a PM figure.



Comparison of PM10 monitoring by OPC-R2 sensor and TSI OPS 3330 and DustTrak instruments. All are set at 5s averaging and are sampling the ambient air of a workshop, the raw 3330 data has been used to calculate a PM figure.

Hexanode Calibration Certificate

SiteHive

15 Feb 2024

Thank you for choosing SiteHive for your realtime environmental management. This calibration certificate is valid for the device below.

Vibration

The vibration device is calibrated by SiteHive through comparison to a reference transducer, in line with testing protocols outlined in ISO 16063-21:2003.

Serial Number	Calibration Date	Calibration Due
VIB-000007	04 Jul 2023	04 Jul 2025

Result

Axis	Frequency (Hz)	Measured value (mm/s)	Reference value (mm/s)	Result (% difference to reference)
x	63	25.7	25.68	Pass (0)
y	63	25.81	25.73	Pass (0)
z	63	25.78	25.73	Pass (0)

Calibration conditions

Temperature	23 °C
Humidity	52 % RH
Mounting surface	Aluminium

Calibration equipment

1 INTRODUCTION

1.1 Project description

Sydney Metro West (SMW) is a new underground railway connecting Greater Parramatta and the Sydney City Business District (CBD). It will provide fast connections between greater Sydney's two major business centres as well as providing better access to the growing business and entertainment precincts in Olympic Park and Pyrmont, the health and medical research hub at Westmead and the future business and tourism site at The Bays.

An Environmental Impact Statement (EIS) (Jacobs/Arcadis, 2020) for the Concept and Stage 1 assessed the surface water quality impacts in response to the Secretary Environmental Assessment Requirements issued by the Department of Planning Housing and Infrastructure (DPHI). The Project was approved on 11 March 2021 (SSI 10038).

Sydney Metro is delivering the Sydney Metro West project via several different packages, including the Western Tunnelling Package (WTP, the Project). Figure 1 is an overview map outlining the extent of the Project.

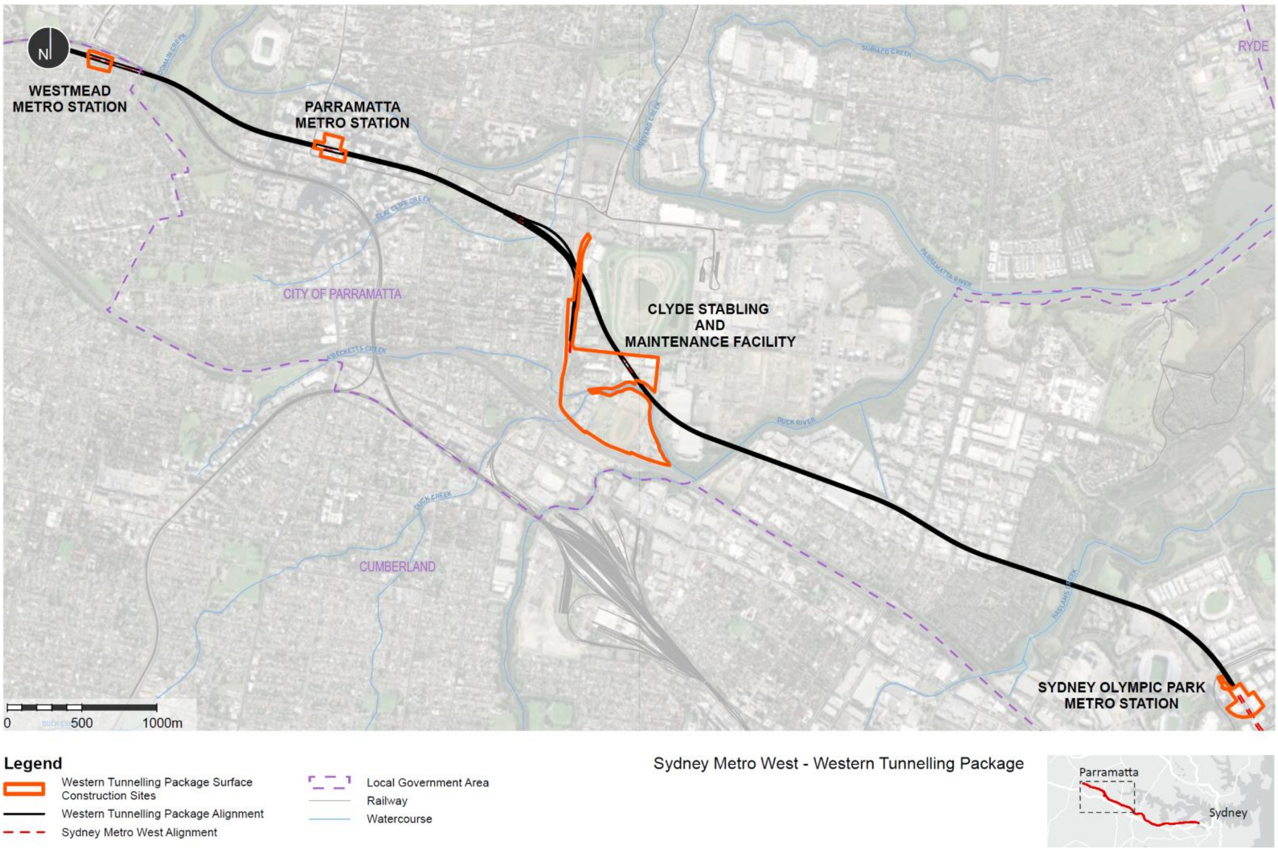

***Figure 1**: WTP Project Map Overview.*

1.2 Project requirements

The Surface Water Quality Monitoring Program (SWQMoP) for the Project (SMWSTWTP-GLO-1NL-EN-PRG-000001) was developed to meet the requirements of Ministers Condition of Approval (MCoA) C14 and Revised Environmental Mitigation Measures (REMM) SSWQ6. The SWQMoP sets out the requirement to develop and issue a Surface Water Quality Monitoring Report (this report), collating surface water quality monitoring data. This report collates surface water monitoring undertaken during the fifth six-month period of construction, from the 20th of July 2024 to the 19th of January 2025.

The Project requirements relevant to the preparation of this Monitoring Report are identified in **Table 1**. A document reference is also included to indicate where the requirement is addressed in this Monitoring Report or other documents. Additional monitoring requirements are outlined in the SWQMoP and surface water quality project requirements are outlined in the Soil and Water Management Plan (SWMP).

Table 1: *Monitoring Report Compliance Matrix.*

Reference	Requirement	Document Reference
MCoA C23	The results of the Construction Monitoring Programs must be submitted to the Planning Secretary, ER and relevant regulatory agencies, for information in the form of a Construction Monitoring Report at the frequency identified in the relevant Construction Monitoring Program.	This document
MCoA D117	Stage 1 of the CSSI must be designed and constructed so as to maintain the NSW Water Quality Objectives (NSW WQO) where they are being achieved as at the date of this approval, and contribute towards achievement of the NSW WQO over time where they are not being achieved as at the date of this approval, unless an Environment Protection License (EPL) in force in respect of the CSSI contains different requirements in relation to the NSW WQO.	This document
CEMF 12.2 (e)	iii. All water will be tested (and treated if required) prior to discharge from the site in order to determine compliance with relevant approvals and licence requirements. No water will be discharged from the site without written approval of the Contractor's Environmental Manager (or delegate). This is to form a Hold Point.	This document
REMM SWQW6	A surface water monitoring program would be implemented to observe any changes in surface water quality that may be attributable to Stage 1 and inform appropriate management responses. The program would be developed in consultation with the (Environment Protection Authority) EPA and relevant Councils. The program would consider monitoring being undertaken as part of other infrastructure projects such as the WestConnex M4 East monitoring. Monitoring would occur during pre-construction and during construction at all waterways with the potential to be impacted. Monitoring sites could be located upstream and downstream of the potential discharges and would include sampling for key indicators of concern.	Section 3.4, 3.6 and 4
SWQMoP	During construction, surface water quality data will be collected, tabulated and assessed against baseline conditions and performance criteria	This report

Reference	Requirement	Document Reference
SWQMoP	The six-monthly monitoring reports will be submitted to the Planning Secretary, the (Environmental Representative) ER, EPA and Sydney Water[1] for information within 60 business days of the reporting period unless otherwise agreed with the Planning Secretary	Section 1.3

1 – The SWQ Monitoring Report need only be issued to Sydney Water where Sydney Water assets are impacted.

1.3 Endorsement and publication

In accordance with the SWQMoP, this report will be issued for information to the Planning Secretary of the Department of Planning Housing and Infrastructure (NSW) (DPHI), the Environmental Representative (ER), Environment Protection Authority (EPA) and Sydney Water within 60 business days of the reporting period.

In line with MCoA B11(e), a copy of this SWQ Construction Monitoring Report will be consolidated with Gamuda Australia - Laing O'Rourke Consortium's (GLC) other Construction Monitoring Reports (CMR's) and published on the project website within a week following submission of the last Construction Monitoring Report to DPHI.

2 DESCRIPTION OF WORKS

2.1 Environment setting

The Project is located within the upper estuary of the Parramatta River Catchment, one of the main tributaries of Sydney Harbour. The Parramatta River catchment and Sydney Harbour includes the Sydney City Business District (CBD) and significant commercial districts of North Sydney and Parramatta. The catchment is highly urbanised and altered from its natural state, with pockets of open spaces and parkland. Most of the catchment is estuarine, up to the tidal limit at Charles Street weir in Parramatta, with freshwater watercourses in the upper catchments of the tributaries of Parramatta River.

Chapter 19 of the Sydney Metro West EIS identifies the water courses listed in **Table 2** as being relevant to the WTP's four key surface construction sites.

Table 2: *Water Courses relevant to the Sydney Metro West – Western Tunnel Package.*

Stage 1 Construction Site	Watercourse	Receiving Waters
Westmead Metro Station	• Domain Creek	• Parramatta River
Parramatta Metro Station	• Parramatta River • Clay Cliff Creek	• Parramatta River
Clyde Maintenance and Stabling Facility (MSF)[1]	• Duck River • Duck Creek • A'Becketts Creek	• Parramatta River
Sydney Olympic Park (SOP)[2]	• Haslams Creek	• Parramatta River

[1] The Clyde Maintenance and Stabling Facility (MSF) consists of three sub-sites, specifically the Clyde Maintenance Facility, Clyde Dive Site, and the Rose Hill Site.
[2] Water associated with GLC activities (including surface water and any residual groundwater seepage) is returned to Rosehill's water treatment plant for treatment and discharge.

Domain Creek is located downstream of the Westmead Site and is the first point of contact for water which drains into the local stormwater system. Surface water from around the perimeter of the Westmead site is collected in protected stormwater pits and which flow into the local stormwater system eventually migrating into Domain Creek.

During the reporting period, the water treatment plant at the Westmead site was operational for on-site reuse only. Water collected from activities at the Westmead site is treated through the water treatment plant and re-used on-site for daily site activities including plant and equipment washdown, concrete and grouting works, and dust suppression. During the reporting period no water from the Westmead water treatment plant was discharged to the local stormwater system.

Surface water from within the vicinity of the Parramatta site drains into the local stormwater system which drains directly to the Parramatta River, upstream of the Charles Street Weir. Although the EIS states that Clay Cliff Creek is relevant to the Parramatta site, no water from the project drains into this creek.

During the reporting period, the Parramatta construction water treatment plant was operational. Water collected from the Parramatta site is treated through the water treatment plant and either beneficially re-used on-site to support construction activities or is discharged to the environment via the local stormwater system. When discharge from the Parramatta construction water treatment plant occurs, treated water is discharged to the Parramatta River downstream of the Charles Street Weir.

Water collected from the activities at Clyde Maintenance and Stabling Facility (MSF) is treated and discharged through the Rosehill water treatment plant directly into Duck River, avoiding the smaller creeks, Duck Creek and A'Becketts Creek. Surface water runoff captured on site is managed via a series of sediment and erosion controls, with captured site water being treated and discharge via the WTP. The implementation of these erosion and sediment controls minimises the risk of site water entering Duck Creek and A'Beckett's creek catchments, which are both tributaries of Duck River and later Parramatta river.

Throughout the reporting period, surface water runoff from SOP was diverted to WTP tunnels and routed back to the Rosehill water treatment plant for treatment and discharge into Duck River. No runoff from within the SOP box associated with Acciona Ferrovial Joint Venture (AFJV) runoff from within the SOP box was treated by GLC during this period.

During this reporting period, groundwater continued to be intersected in the shaft excavation at the Clyde Dive Site in both the Dive excavation works and the mined tunnels, the Rosehill box and Tunnel Boring Machine (TBM) tunnels, as well as within the Westmead box, cavern and stub tunnel excavations. Negligible amounts of groundwater were encountered at the SOP station box on account of the site being completely excavated and sealed prior to GLCs presence on site in late 2023. Minor amounts of groundwater were also intercepted in the Parramatta station box excavation.

Throughout the reporting period, all groundwater was directed to either the Rosehill Permanent water treatment plant, or Parramatta Construction water treatment plant for treatment and re-used on site or discharged via the licensed discharge points at Duck River (EPL discharge Point 4) and Parramatta River (EPL discharge Point 5). In the case of SOP, groundwater was redirected to Rosehill's water treatment plant for treatment and discharge. During the reporting period, there were instances where the Water Treatment Plants were not discharging to the environment due to maintenance, or failed treatment rounds. In these instances, water was taken off-site to be disposed at a licenced facility or re-used on site to support construction where on-site re-use requirements are reduced.

2.2 Project activities undertaken during the reporting.

Construction activities undertaken during the reporting period are summarised in **Table 3** below. As part of the Project, three (3) water treatment plants are commissioned for use as outlined in **Table 4**. Only two (2) Water Treatment Plants however discharged water offsite during the reporting period. Parramatta and Rosehill discharged approximately 8.7ML and 242ML of water to the EPL discharge points at Parramatta River and Duck Creek, respectively.

***Table 3:** Construction activities undertaken during the reporting period.*

SITE	CONSTRUCTION ACTIVTIES	OFFSITE DISCHARGE
Westmead	• Box excavation (with hydraulic hammers). • Box excavation (with acoustic shed/cover). • Box excavation – rock-bolting/shotcrete (within acoustic shed/cover). • Mined tunnel excavation. • Delivery and off hire of equipment. • Off-site Spoil haulage. • Gantry crane operation. • Installation of monitoring equipment. • General operation of ancillary facility. • Minor services relocation along Hawksbury Road. • Waterproofing. • Form Reo Pour (FRP) of permanent tunnel lining. • Euroform assembly. • Removal of concrete divider (for stockpiling) in Acoustic Shed	No
Parramatta	• Archaeological clearance. • Removal and/or relocating utilities. • Establishing and demolition concrete slabs or piling platforms. • Station box pile break back/trim. • FRP – concrete works. • Box excavation ground support – internal struts & waler Installation. • Box excavation to ~26m. • Off-site Spoil haulage • Delivery of equipment/general truck movements. • General operation of ancillary facilities. • Establishment of internal haul roads and station box bridge. • Nozzle construction works (fissure grouting, canopy tubes installation, concrete D-wall removal, ground support and excavation, tunnel spoil loadout, and rock bolting) • Tunnel invert concreting works. • Installation of monitoring equipment. • Station box maintenance works. • Water management/ dewatering.	Yes, discharge to EPL point five (Parramatta River)

SITE	CONSTRUCTION ACTIVTIES	OFFSITE DISCHARGE
Clyde Dive	• Final excavation and construction of the decline structure. • Junction caverns excavation and waterproofing. • FRP for deflection wall and dive structure, tunnel inverts, caverns and arches. • General operation of ancillary facilities. • Spur tunnel excavation, waterproofing, and lining. • Transport of excavated material and concrete waste. • Minor utilities relocations. • HV protection slab investigation. • Lining Erection Machine (LEM) assembly and operation. • LEM grout plant set up and operation, segment storage and delivery.	Yes, transfer to Rosehill Water Treatment Plant
Clyde MSF	• Excavation of the utility service corridor. • Remediation of contaminated hotspots. • Potential Acid Sulphate Soil (PASS) treatment. • Management of erosion and sediment controls including dewatering system. • Bulk earthworks. • General operation of ancillary facilities. • Utility adjustment works. • Construction of the bridging structure abutments. • Construction of retaining wall structures. • Construction of water conveyance structures. • Construction of storm drainage systems. • FRP works. • Construction of flood relief culvert. • Piling and abutments. • Construction of new road alignments. • Construction of temporary creek crossings.	Yes, transfer to Rosehill Water Treatment Plant
Rosehill	• Delivery of equipment and segments. • General operation of ancillary facility. • TBM excavation. • Cross Passage excavation. • Water treatment plant operation and water discharge. • Grout batching plant operation. • Tree removal along Unwin Street. • Transportation of excavated material and concrete waste. • General operation of ancillary facilities.	Yes, discharged to EPL point four (Duck River)

SITE	CONSTRUCTION ACTIVTIES	OFFSITE DISCHARGE
SOP	• Nozzle construction and FRP. • TBM retrieval. • General operation of ancillary facilities. • Cross passage excavation and waterproofing. • Spoil loadout. • Removal of cross passage ramps. • FRP of cross passage and inverts.	Yes, transfer to Rosehill Water Treatment Plant.

Table 4: *Water treatment plants commissioned for the Project.*

Water treatment plant	Discharge point (EPL)	Status during reporting period
Westmead Permanent water treatment plant	**Point 3 -** Parramatta River, stormwater system on Alexandra Avenue	No water has been discharged off-site during the reporting period. Water has only been reused on-site or disposed off-site to a licensed waste facility.
Rosehill Permanent water treatment plant	**Point 4** - Duck River	Plant was operational during the reporting period.
Parramatta Construction water treatment plant	**Point 5 -** Parramatta River, downstream of the Charles Street weir	Plant was operational during the reporting period.

3 MONITORING METHODOLOGY

3.1 Methodology

The SWQMoP outlines the methodology to be adopted in monitoring surface water during construction. It outlines the proposed monitoring locations, schedule for monitoring and the methodology including calibration requirements.

Additionally, the SWQMoP outlines a four-step method to assessing the results in construction compliance reports. Due to the highly variable background results, a step-based trigger action approach will be applied when reviewing and responding to the surface water quality monitoring results to determine the significance of the exceedance(s) and possible causes. The assessment of the results obtained during this reporting period is further discussed in **Section 4** below.

3.2 Equipment and analysis

Monitoring locations were sampled in accordance with the SWQMoP. Samples were collected from approximately 150mm below the water surface (where achievable) using water sampling containers supplied by Envirolab – a National Association of Testing Authorities (NATA) accredited laboratory. Samples were then placed on ice and held in an insulated container until delivery to the NATA accredited laboratory under chain of custody protocol. The samples were submitted for analysis for all parameters required in the SWQMoP.

Water Quality Objectives (WQOs) were measured in-situ at each sampling location using a Horiba multi-probe monitoring device and general site conditions were noted. A calibration check was undertaken at the start of each sampling round to ensure that the monitor was reading accurately. In addition, laboratory calibration was undertaken periodically throughout the reporting period to ensure that the multiprobe device was operating to specification. Calibration records are presented in ***Attachment 1 – Calibration Certificates***.

Further to the above analysis, all samples collected by GLC will also be subject to a Quality Assurance (QA) and Quality Control (QC) testing regime undertaken by Envirolab in which:

- Duplicates will be collected and analysed at a rate of 1 in every 10 primary samples
- Triplicates will be collected and analysed at a rate of 1 in every 20 primary samples
- Reinstate samples will be collected and analysed at a rate of one every sampling event.

These testing regimes are determined by the laboratory of choice and may be varied based on changes to their own QA /QC protocol. It is not influenced by GLC. Results of these QA/QC tests are supplied to GLC on a routine basis and stored on GLC's internal filing system.

3.3 Sampling during the reporting period

In accordance with the SWQMoP, surface water monitoring is required under the scenarios detailed in **Table 5**.

Table 5: *Surface Water Monitoring Schedule.*

Type	Frequency	Reference	Responsibility
Monthly Water Quality Monitoring	Monthly	WQOs ANZG 2018	Environmental Coordinator/Manager
Wet Weather Inspection	Additional inspections would occur (where safe/practical) when more than 20mm of rain is received within a 24-hour period.	CEMF 12.2 (e)(ii)	Environmental Coordinator/Manager
Incident Response	At any time in response to a complaint or incident	MCoA A43	Environmental Coordinator/Manager

Six (6) monthly monitoring events were completed during the reporting period as detailed in **Table 6** below. No sampling events were undertaken in response to incidents during the reporting period.

Table 6: *Surface water sampling events during the reporting period.*

Date	Sampling Round Type	Parameters Monitored	Comments
09/08/2024	Monthly	WQOs ANZG 2018	All sampling points captured
30/09/2024	Monthly	WQOs ANZG 2018	All sampling points captured with the exception of SW01 and SW02, which were inaccessible, and SW05, which was permanently removed from the SWQMoP.
31/10/2024	Monthly	WQOs ANZG 2018	All sampling points captured with the exception of SW04, which was permanently removed from the SWQMoP. SW01 was permanently relocated to a more accessible location nearby and sampling was captured.
21/11/2024	Monthly	WQOs ANZG 2018	All sampling points captured
16/12/2024	Monthly	WQOs ANZG 2018	All sampling points captured
14/01/2025	Monthly	WQOs ANZG 2018	All sampling points captured

3.4 Monitoring locations

Due to a progression of construction activities and following recommendations from the fourth sixth-monthly construction monitoring report, several Sampling Points were removed and or relocated for various reasons. These include:

- Sampling point SW01 was relocated approximately 100m upstream from the previous sampling location as the original location was impacted by the expansion of the construction site. The new location is located on Duck Creek, upstream of construction activities, and provides a safely accessible sampling point. Pre-construction baseline data from the original SW01 location remains representative of the new sampling location given it has the same catchment, is located <100m upstream of the prior location, and because it is unaffected by WTP related construction activities.

- Sampling points SW04 and SW05 were permanently removed in October 2024 and September 2024 respectively due to the relocation of EPL Discharge Point 5. New sampling locations were identified and recorded as SW07 and SW11 to the SWQMoP and were included in the 2024 update to the SWQMoP.
- Sampling point SW12 was also removed from this six-monthly construction monitoring report due to an absence of WTP Construction activities which could otherwise have an impact on Haslam Creek.

The surface water sampling locations are summarised in **Table 7**, shown graphically in **Figure 4 and 5**, along with the EPL Discharge points. Images of the sampling locations during the reporting period have been presented in **Figure 4**, noting the former and new SW01 sampling locations are captured in the August 2024 and November 2024 monitoring rounds respectively. Where there are extraneous factors limiting access to specific monitoring points, representative monitoring locations that differ slightly to the SWQMoP would be selected if possible.

***Table 7:** Sydney Metro West - WTP surface water sampling locations.*

Sample Name	Waterway	Rationale	Nearest Access Point	Coordinates	Comments
SW01-WTP	Duck Creek	Upstream of Clyde MSF Construction sites	Kay Street	33°49'50.82"S 151° 1'19.32"E	Location used until September 2024
			James Ruse Drive	33° 49' 53.17" S 151° 1' 12.02" E	New location adopted from October 2024
SW02-WTP	Duck Creek	Downstream of Clyde MSF Construction sites / before confluence with Duck River	Deniehy Street	33°49'58.58"S 151° 1'41.11"E	
SW03-WTP	Duck River	Downstream of Clyde MSF Construction sites / after confluence with Duck Creek	Holker Street, Silverwater	33°82'93.86" S 151° 0'24.68"E	
SW04-WTP	Parramatta River	Upstream of potential treatment plant discharge location	Parramatta River Walk (upstream Barry Wilde Bridge)	33°48'42.85"S 151° 0'25.03"E	Monitoring point removed starting from the October 2024.
SW05-WTP	Parramatta River	General streamflow sample	Parramatta River Walk (upstream Elizabeth Street Footbridge)	33°48'45.57"S 151° 0'30.41"E	Monitoring point removed September 2024 sampling event.
SW06-WTP	Parramatta River	Targeting saltwater zone below weir	Parramatta River Walk (upstream Ferry Wharf)	33°48'47.83"S 151° 0'35.37"E	
SW07-WTP	Domain Creek	Downstream of Westmead Construction Site	West Domain Avenue	33°48'33.46"S 150°59'35.58"E	
SW08-WTP	Duck River	Upstream of confluence with Duck Creek	Access from Martha Street via cycle path	33°83'52.91"S 151°02'94.05"E	
SW09-WTP	A'Becketts Creek	Upstream of Clyde MSF construction sites	Clyde Dive Construction Site	33°49'46.2"S 151°01'12.3"E	

Sample Name	Waterway	Rationale	Nearest Access Point	Coordinates	Comments
SW10-WTP	Domain Creek	Upstream of Westmead Construction Site	Parramatta Park (south of Park Parade)	-33°81’105’’S 150°99’175’’E	
SW11-WTP	Parramatta River	Downstream of Parramatta Discharge Point	Queens Wharf Park (south of Parramatta River)	33°48’54.5’’S 151°00’42.1’’E	
SW12-WTP[1]	Haslams Creek	Downstream of Sydney Olympic Park construction site	Bennelong Parkway bridge	33° 50' 5.28'' S 151° 4' 33.1968'' E	No samples were collected from this monitoring point during the reporting period.

[1] Monitoring point SW12 (SOP - Haslams Creek) was included in the SWQMoP in the February 2024 update in anticipation for potential surface water quality impacts by WTP and mimics the sampling location utilised by AFJV’s SWQMoP. However, given water treatment and discharge at SOP was managed by AFJV on behalf of GLC up until TBM breakthrough on July 8th, 2024, any surface water impacts in surrounding waterways have been monitored by AFJV’s SWQMoP. Considering GLC did not undertake any treatment or discharge to waterways in the vicinity of SOP, no sampling of waterways at SW12 occurred by GLC given the discharge parameters of AFJV’s water treatment plant are different to those used and known by GLC and any impacts could not be isolated to GLC alone. Refer to AFJV’s monitoring report for water quality results associated with Haslam Creek. SW12 will be omitted from the surface water quality monitoring program.

3.5 Parameters and Contaminants of concern

As outlined in the SWQMoP, the surface water monitoring parameters adopted for the Project are detailed in Table 8. The following potential contaminants were sampled in accordance with **Section 5.4.2** of the SWQMoP:

- Metals (As III, AS V, Cd, Cr III, Cr VI, Cu, Co, Fe, Hg, Pb, Mn, Ni, Zn)
- Benzene, toluene, ethylbenzene, xylene, naphthalene
- Polycyclic aromatic hydrocarbons
- Nutrients and Inorganics – total nitrogen, total phosphorous, total oxidized nitrogen, nitrate, nitrite, total ammonia
- Per- and polyfluoroalkyl substances (PFAS)
- Petroleum hydrocarbons

Table 8: *Sydney Metro West - WTP adopted surface water monitoring assessment criteria.*

Indicator / Parameter	Upper Estuary	Lowland Rivers
Turbidity (NTU)	0.5 – 10	6 - 50
Dissolved Oxygen (%)	80 -110%	85 – 110%
Conductivity (µS/cm)	NA	125 - 2200
pH (units)	7.0 – 8.5	6.5 – 8.5
Oil and grease	Nonvisible on surface	Nonvisible on surface
Toxicants (listed above)	ANZG 2018	ANZG 2018

3.6 Baseline data (pre-construction)

The Sydney Metro West EIS does not contain any baseline surface water quality data. In lieu of any baseline data, a review of data sourced from surrounding major projects and additional pre-construction surface water quality sampling was undertaken and are presented in **Table 9**.

Although these results will give an indication of pre-construction water quality, these results are not directly comparable to the WTP sampling locations utilised during this report and should only be used as reference.

Table 9: *Baseline Water Quality Data (Source: Sydney Metro West EIS).*

Indicator	ANZECC/ARCANZ WQ Guidelines 2000	Duck River	Duck Creek (Kay St)	Parramatta River (Barry Wilde Bridge)	Parramatta River (Elizabeth St Footbridge)	Parramatta River (Upstream of Ferry Wharf)
Turbidity (NTU)	Upper Estuary 0.5–10 Lowland Rivers 6-50	37.1	24.1	14.3	10.05	14
Dissolved Oxygen (mg/L)	N/A	4.9	7.4	8.7	9.0	7.6
Dissolved Oxygen (%)	85-110	49.2	67.3	95.4	98.2	82.4
Conductivity (mS/cm)	Lowland rivers: 125–2200 µS/cm	7.00	1.42	452.5	457	432
Salinity (ppt)	N/A	7.5	0.71	-	-	-

pH	7.0 – 8.5	7.50	7.98	7.97	8.20	7.4

To provide more accurate baseline data for comparison throughout construction of the Project, a total of six (6) pre-construction sampling rounds were undertaken at the nominated sampling points in the SWQMoP (Rev C). ***Attachment 2*** contains tabulated preconstruction data as well as the 6 – monthly water quality data collected during this reporting period both compared against the adopted assessment criteria**.** As the GLC SWQMoP has collected a significant volume of pre-construction baseline data, the data presented in **Table 9** will be omitted from further discussion in this report.

The pre-construction baseline monitoring highlights that several water parameters are above the adopted trigger levels. This is likely attributed to the highly disturbed nature of the catchments that drain into the waterways. Parameters that were recorded above the adopted assessment criteria in pre-construction sampling rounds are detailed in **Table 10** and described below:

- Turbidity and dissolved oxygen were consistently recorded outside the adopted criteria across all sampling locations. This is indicative of poor water quality is poor.
- Nutrients such as Phosphorus and Nitrogen were generally found to be above the adopted screening criteria in all sampling locations, which is typical of waterways that receive run off from urban areas where fertilisers may be used (or a product of waste).
- Several toxicant parameters including nutrients, heavy metals and PFAS were also consistently recorded results outside the adopted assessment criteria. This is likely attributed to the historic large-scale commercial/industrial practices undertaken within and upstream of the catchment areas.
- All waterways sampled in the surface water monitoring program are part of the local stormwater catchments that receive large flows of runoff from the greater Parramatta area.

Refer to ***Attachment 2*** for the adopted assessment criteria for each sampling location.

Table 10: *Pre-Construction Monitoring results in excess of the adopted assessment criteria.*

Sample Location	Parameter	Max Concentration Recorded	Assessment Criteria
SW01	Turbidity	50.9 NTU	0.5 – 10 NTU
	Dissolved Oxygen	24.3%	80 – 110 %

4 RESULTS

4.1 Rainfall summary

Rainfall data from the monitoring period is displayed in **Figure 5**. Notable lower rainfall was recorded in August and October 2024.

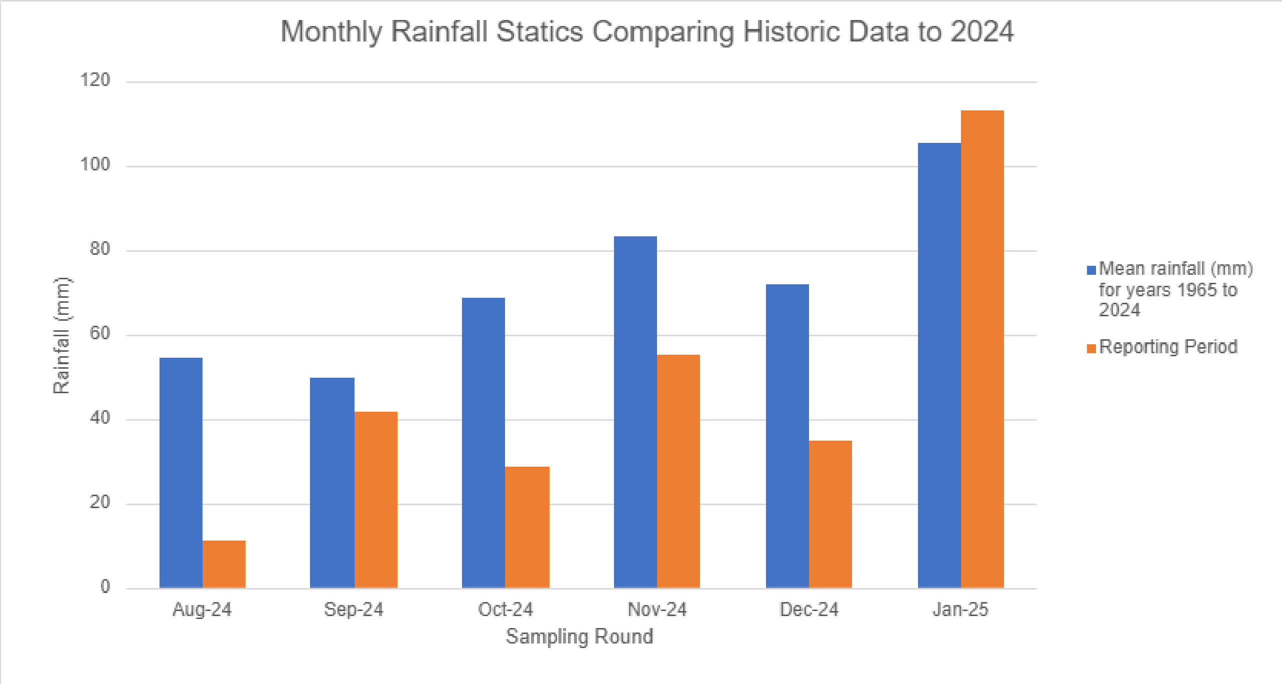

Figure 5: *Rainfall statistics recorded during the monitoring period compared against historic averages (Bureau of Meteorology (BOM)).*

4.2 Monitoring results

Tabulated monitoring results are attached to this report in ***Attachment 2***. Monitoring data has been compared against the relevant WQOs and ANZG 2018 assessment criteria. Laboratory certificates can be found in ***Attachment 3***.

Consistent with the pre-construction sampling, several parameters exceeded the assessment criteria at all sampling points. These results are discussed in detail in **Section 5**.

5 DISCUSSION

5.1 Assessment of results

Analytes that have exceeded the assessment criteria from this monitoring round have been graphed alongside data from previous monitoring rounds and pre-construction sampling to provide an analysis of trends. These graphs are provided in ***Attachment 4****.*

The surface water monitoring locations and parameters adopted for WTP are detailed in **Table 7** and **Table 8**, respectively. The adopted assessment criteria for each monitoring location are outlined in **Table 11** below.

Where results were returned outside the assessment criteria, they were assessed in accordance with the four-step process detailed in the SWQMoP and discussed below.

Table 11: Adopted assessment criteria for each WTP monitoring location.

Assessment Criteria with reference to ANZG 2018	Sample point
Upper Estuary	SW01, SW02, SW03, SW06, SW08, SW09, SW11
Lowland Rivers	SW07, SW10

5.1.1 Step 1

'*In the event of an exceedance of any of the trigger values, a review will be initiated to determine the significance of the exceedance and the possible causes'*.

Surface water sampling results were compared against the relevant WQOs and ANZG 2018 assessment criteria. The number of results recorded outside the assessment criteria is listed in **Table 12**. As such, further analysis of these parameters was undertaken in accordance with Step 2 of the Surface Water Quality Monitoring Program, see below.

Table 12: *Number of parameters recorded outside the assessment criteria in each sampling round.*

Sample Point	Number of Parameters Recorded Outside the Assessment Criteria					
	Aug-24	Sep-24	Oct-24	Nov-24	Dec-24	Jan-25
SW01	4	NA[1]	4	5	6	5
SW02	5	NA[2]	3	5	5	5
SW03	4	4	3	3	3	3
SW04	4[3]	3[3]	NA[4]	NA[4]	NA[4]	NA[4]
SW05	6[5]	NA[6]	NA[6]	NA[6]	NA[6]	NA[6]

Sample Point	Number of Parameters Recorded Outside the Assessment Criteria					
	Aug-24	Sep-24	Oct-24	Nov-24	Dec-24	Jan-25
SW06	3	4	3	4	4	4
SW07	5	3	7	5	7	5
SW08	4	5	4	4	5	6
SW09	6	5	4	5	6	4
SW10	5	5	3	4	5	5
SW11	5	5	3	4	4	3

[1] SW01 not sampled – location was inaccessible at the time of sampling due to excavation works being undertaken in the creek line.
[2] SW02 not sampled – location was inaccessible at the time of sampling due to the presence of a snake, posing a safety risk.
[3] SW04 sampled – however, data will not be used to explain exceedances upstream or downstream as the point is permanently removed from the monitoring report.
[4] SW04 not sampled – monitoring point was removed starting from October 2024.
[5] SW05 sampled – however, data will not be used to explain exceedances upstream or downstream as the point is permanently removed from the monitoring report.
[6] SW05 not sampled – monitoring point was removed starting from September 2024.

5.1.2 Step 2

'A comparison will be undertaken between the upstream and downstream values'.

For the parameters that exceed the adopted assessment criteria, an assessment was undertaken comparing the results of up and down stream sampling locations. Where the downstream concentration of contaminants is consistent with the upstream contaminant concentrations, no further action would be taken.

Further investigation was deemed necessary under the following circumstances:

1. Where the downstream value is greater than 2x than the upstream value for any parameter that exceeds the adopted trigger criteria upstream of the project site (i.e., ANZG / ANZECC DGVs), Steps 3-4 would be followed.
2. Where the downstream value exceeds the adopted trigger criteria (i.e., ANZG / ANZECC DGVs) and upstream value does not Steps 3-4 would be followed.

Following the assessment under Step 2, it was identified that there were twenty-seven (27) instances where downstream sampling points recorded concentrations of an analyte more than twice an upstream sampling location or exceeded the assessment criteria where the upstream sampling location did not. These 27 exceedances have been listed below in **Table 13** and are discussed in **Section 5.1.3**. During the reporting period, exceedances were identified in samples collected at Westmead, Parramatta, and Clyde MSF sampling locations.

Table 13: Samples where downstream values outside the range of the upstream values.

Sampling Round	Parameter	Assessment Criteria	Upstream Point	Upstream Result	Downstream Point	Downstream Result	Exceedance Number
Aug - 24	Turbidity (field)	6.0 – 50.0 NTU	SW10	0	SW07	126.0	One
Aug - 24	Turbidity (field)	0.5 – 10.0 NTU	SW06	5.7	SW11	0.0	Two
Aug - 24	Turbidity (field)	0.5-10 NTU	SW09 & SW01	8.5 & 5.0	SW02	0.0	Three
Aug - 24	Turbidity (field)	0.5-10 NTU	SW02 & SW08	1.4 & 3.4	SW03	28.0	Four
Sep - 24	DO%	80.0 – 110.0%	SW06	102.9	SW11	78.8	Five
Oct - 24	pH (field)	6.5 – 8.5	SW10	7.05	SW07	8.66	Six
Oct - 24	Turbidity (field)	6.0 – 50.0 NTU	SW10	7.6	SW07	5.7	Seven
Oct - 24	Ammonia	0.9 mg/L	SW10	0.53	SW07	5.7	Eight
Oct - 24	Copper (dissolved)	1.4 ug/L	SW10	1.0	SW07	5.0	Nine
Oct - 24	Zinc (dissolved)	8.0 ug/L	SW10	6.0	SW07	10.0	Ten
Oct - 24	Turbidity (field)	0.5 – 10.0 NTU	SW07	5.7	SW06	10.5	Eleven
Oct - 24	Zinc (dissolved)	8.0 ug/L	SW06	8.0	SW11	13.0	Twelve
Nov - 24	Ammonia	0.9 mg/L	SW10	0.53	SW07	0.91	Thirteen
Nov - 24	Zinc (dissolved)	8.0 ug/L	SW10	9.0	SW07	21.0	Fourteen
Nov - 24	Zinc (dissolved)	8.0 ug/L	SW01	9.0	SW02	21.0	Fifteen
Dec – 24	Turbidity (field)	6.0 – 50.0 NTU	SW10	1.5	SW07	0.3	Sixteen
Dec – 24	Ammonia	0.9 mg/L	SW10	0.42	SW07	6.9	Seventeen
Dec – 24	Total Nitrogen	2.4 mg/L	SW10	1.1	SW07	8.2	Eighteen

Sampling Round	Parameter	Assessment Criteria	Upstream Point	Upstream Result	Downstream Point	Downstream Result	Exceedance Number
Dec – 24	Cobalt (dissolved)	1.4 ug/L	SW10	<1	SW07	2.0	Nineteen
Dec – 24	Phosphorus	0.03 mg/L	SW07	0.1	SW06	0.2	Twenty
Dec – 24	Copper (dissolved)	1.3 ug/L	SW07	<1	SW06	2.0	Twenty-one
Dec-24	Copper (dissolved)	1.3 ug/L	SW02 & SW08	1.0 & 1.0	SW03	2.0	Twenty-two
Jan - 25	Turbidity (field)	6.0 – 50.0 NTU	SW10	14.3	SW07	3.4	Twenty-three
Jan - 25	DO%	85.0 – 110.0%	SW10	157.3	SW07	58.2	Twenty-four
Jan - 25	Turbidity (field)	0.5 – 10.0 NTU	SW07	3.4	SW06	11.9	Twenty-five
Jan-25	Copper (dissolved)	1.3 ug/L	SW09 & SW01	1.0 & 1.0	SW02	2.0	Twenty-six
Jan-25	Zinc (dissolved)	8.0 ug/L	SW01	9.0	SW02	27.0	Twenty-seven

5.1.3 Step 3

'Where the exceedance of the preliminary trigger value occurs, a review will be initiated to determine the significance of the exceedance and the possible causes'.

As shown in Table 13, exceedances of criteria were investigated and are explained below with upstream sampling points preceding the downstream sampling points:

- **Exceedance one – SW10 to SW07 – August 2024 – Turbidity (field)**

Both upstream and downstream field turbidity levels between SW10 and SW07 in August were observed as being outside the ANZG 2018 criteria. While the downstream values were considerably higher, these turbidity levels were comparable to the baseline levels recorded at SW07. The NATA accredited lab results for SW07 showed turbidity results that were within the ANZG 2018 criteria (NTU = 13). The abnormal field exceedance, according to ANZG 2018 Standard could be attributed to sampling conditions such as lower temperatures resulting in reduced turbidity probe readings accuracy. The returned lab results are considered more accurate than field sampling conditions, and therefore no further action was needed. It should be noted that it is unlikely that that the observed turbidity levels are related to the construction activities as no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance two – SW06 to SW11 – August 2024 – Turbidity (field)**

The downstream field turbidity levels recorded in August were below the ANZG 2018 criteria at SW11, but within the criteria for SW06. The NATA accredited lab results for SW06 and SW11 however showed turbidity results that were within the ANZG 2018 criteria (NTU = 5 and 2.4 respectively). The abnormal field exceedance, according to ANZG 2018 Standard could be attributed to sampling conditions such as lower temperatures resulting in reduced turbidity probe readings accuracy. The returned lab results are considered more accurate than field sampling conditions, and therefore no further action was needed.

It should also be noted that the Parramatta water treatment plant was already commissioned in August 2024. Biweekly water sampling was conducted and two permits to discharge water were issued – all of which were compliant with the EPL. No discharge incidents or non-conformances were reported.

- **Exceedance three – SW01 & SW09 to SW02 – August 2024 – Turbidity (field)**

The turbidity levels recorded are comparable to the baseline levels recorded at SW02. The corresponding NATA accredited lab results for SW02 (NTU = 1.4) and both upstream locations (SW09 = 9.2 and SW01 = 4.9) returned turbidity results within the assessment criteria, suggesting the environmental conditions such as temperature, were unfavourable to obtaining accurate field turbidity results (ANZG 2018). It is also unlikely that the low turbidity levels are related to the construction activities being undertaken at the Clyde MSF site given that the Rosehill water treatment plant discharges downstream of sampling point SW02.

- **Exceedance four – SW02 & SW08 to SW03 – August 2024 – Turbidity (field)**

The exceedance of turbidity (field) results recorded at SW03 is comparable to baseline levels. Field observations during sampling identified an organic foam layer on the water's surface. Turbidity concentrations returned to within the assessment criteria during the September 2024 sampling round (SW03 = 9.4), indicating no increasing trend in turbidity concentrations. Instead, the elevated turbidity levels in August were likely due to the foam layer identified during the sampling process.

- **Exceedance five – SW06 to SW11 – September 2024 – Dissolved Oxygen %**

SW11 recorded DO% exceedance at SW11 is comparable to DO% data collected from former surface water sampling occurrences prior to the commissioning of the Parramatta water treatment plant. A consistent trend of DO% values being outside the ANZG 2018 limit indicates that the discharge of Parramatta water treatment plant is unlikely to influence the DO% readings. The exceedance can be related to other external factors such as industrial and recreational activities along Parramatta River, high nutrient content and therefore oxygen demand.

- **Exceedance six – SW10 to SW07 – October 2024 – pH (field)**

The pH levels recorded in the October 2024 sampling round are slightly higher than the ANZG 2018 criteria. However, SW07's corresponding lab sample returned results within the adopted ANZG 2018 criteria (pH =7.7). It should be noted that it is unlikely that the higher pH level recorded during field sampling is related to the construction activities being undertaken at the Westmead site given that that no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance seven – SW10 to SW07 – October 2024 – Turbidity (field)**

The turbidity levels recorded in the October 2024 sampling round are comparable to the baseline levels recorded at SW07. The NATA accredited lab results in October for SW07 (3.1) and SW10 (3.9) showed consistently low turbidity readings which are unlikely to be attributed to construction activities given that no offsite discharge occurred from the Westmead water treatment plant throughout the monitoring period.

- **Exceedance eight – SW10 to SW07 – October 2024 – Ammonia**

The ammonia levels recorded in the October 2024 sampling round is higher than the ANZG 2018 criteria for the downstream point SW07 but within criteria for the upstream point SW10. The recorded exceedance cannot be corelated to construction activities at Westmead construction site as no discharge took place prior to the sampling event. The recorded exceedance can be attributed to external factors unrelated to construction activities such as stormwater runoff from residential and commercial activities occurring in the catchment of Domain Creek.

- **Exceedance nine – SW10 to SW07 – October 2024 – Copper (dissolved)**

The copper levels recorded in the October 2024 sampling round exceeded the ANZG 2018 criteria for downstream sampling point SW07 and was within the criteria for the upstream sampling point, SW10. The recorded exceedance is however comparable to the baseline levels recorded at SW07, suggesting the high copper levels are unrelated to the construction activities. This is on account no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance ten – SW10 to SW07 – October 2024 – Zinc (dissolved)**

The zinc levels recorded in the October 2024 sampling round exceeded the ANZG 2018 criteria for downstream sampling point SW07 and was within the criteria for the upstream sampling point, SW10. The recorded copper exceedance is however comparable to the baseline levels recorded at SW07 suggesting the higher copper levels are unrelated to the construction activities. This is on account no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance eleven – SW07 to SW06 – October 2024 – Turbidity (field)**

The turbidity levels recorded in the October 2024 sampling round are comparable to the baseline levels recorded at SW06. The corresponding NATA accredited lab results at SW07 and SW06 however, returned turbidity results within the ANZG 2018 criteria (3.1 and 6.7 respectively). It is therefore unlikely that the elevated field turbidity levels are related to the construction at the Westmead site given that no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. Also, the elevated turbidity cannot also be attributed to Parramatta water treatment plant discharge as SW06 is upstream of EPL point 5.

- **Exceedance twelve – SW06 to SW11 – October 2024 – Zinc (dissolved)**

The zinc levels recorded at SW11 in the October 2024 sampling round is comparable to zinc data collected from surface water sampling rounds prior to the commissioning of the Parramatta water treatment plant. Throughout GLC's implementation of the SWQMoP, zinc levels have been consistently observed to reside outside the ANZG 2018 assessment criteria, suggesting that the discharge from Parramatta's WTP is unlikely to influence zinc levels. Instead, these exceedances are likely attributed to other external factors such as stormwater runoff from commercial, industrial and recreational activities in the catchment of Parramatta River.

It should also be noted that the Parramatta water treatment plant was already commissioned in October 2024. Monthly water sampling was conducted and one permit to discharge water was issued, accordingly. The discharged water from the Parramatta water treatment plant was compliant with the EPL for point 5 and therefore could not have contributed to the observed exceedance of Zinc. No discharge incidents or non-conformances were identified or reported at the time of the exceedance.

- **Exceedance thirteen – SW10 to SW07 – November 2024 – Ammonia**

The ammonia levels recorded in the November 2024 sampling round is higher than the ANZG 2018 criteria for the downstream point SW07 and within criteria for the upstream point SW10. The recorded exceedance cannot be corelated to construction activities at Westmead construction site as no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. In accordance with the ANZG 2018 Standard, the exceedance can be related to other external environmental factors such as decreased pH and water temperature which increase the levels of unionised ammonia, affecting the total ammonia values.

- **Exceedance fourteen – SW10 to SW07 – November 2024 – Zinc (dissolved)**

The zinc levels recorded in the November 2024 sampling round exceeded the criteria for both upstream and downstream sampling points, with SW07 being more than double the concentration of SW10. The recorded exceedance is however comparable to the baseline levels recorded at SW07. It should be noted that it is unlikely that the high zinc levels are related to the construction activities being undertaken at the Westmead site given that no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance fifteen – SW01 to SW02 – November 2024 – Zinc (dissolved)**

While the downstream zinc value was higher than the upstream value during the November 2024 monitoring event, this result was consistent with the baseline data, indicating that the elevated zinc (dissolved) concentration observed was not due to GLC construction activities but rather is a product of natural variation in the environment or other influencing factors (i.e commercial/industrial sources). This is further supported by the fact the Rosehill WTP discharge location is downstream of both sampling points, making it an unlikely contributor to the observed results.

- **Exceedance sixteen – SW10 to SW07 – December 2024 – Turbidity (field)**

The turbidity (field) levels recorded in the December 2024 sampling round are comparable to the baseline levels recorded at SW07. The corresponding NATA accredited lab results for both sampling locations however also returned turbidity results that were outside the ANZG 2018 criteria (SW10 = 3.2, SW07 = 4), however these were comparable to the baseline lab results for SW07 and historic data for SW10. It should be noted that it is unlikely that the low turbidity levels encountered during field sampling are related to the construction activities being undertaken at the Westmead site given that that no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance seventeen – SW10 to SW07 – December 2024 – Ammonia**

The ammonia levels recorded in the December 2024 sampling round is higher than the ANZG 2018 criteria for the downstream point SW07 and within criteria for the upstream point SW10. The recorded exceedance cannot be corelated to construction activities at Westmead construction site as no off-site discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. In accordance with the ANZG 2018 Standard, the exceedance can be related to other external environmental factors such as reduced pH and water temperature which increase the levels of unionised ammonia, affecting the total ammonia values.

- **Exceedance eighteen – SW10 to SW07 – December 2024 – Total Nitrogen**

The total nitrogen levels recorded in the December 2024 sampling round is higher than the ANZG 2018 criteria for the downstream point SW07 and within limit for the upstream point SW10. The recorded exceedance cannot be corelated to construction activities at Westmead construction site as no off-site discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. The exceedance can be related to other external environmental factors such as nutrient run-off from commercial and residential activities occurring within the stormwater catchment of Domain Creek.

- **Exceedance nineteen – SW10 to SW07 – December 2024 – Cobalt (dissolved)**

The cobalt levels recorded in the December 2024 sampling round is higher than the ANZG 2018 criteria for the downstream point SW07 and within limit for the upstream point SW10. The recorded exceedance cannot be corelated to construction activities at Westmead construction site as no off-site discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. The exceedance can however be related to stormwater run-off from commercial and industrial activities occurring within the catchment of Domain Creek.

- **Exceedance twenty– SW07 to SW06 – December 2024 – Phosphorus**

The phosphorus levels recorded in the December 2024 sampling round is higher than the ANZG 2018 criteria for both the downstream and upstream points, with the downstream value being twice the upstream reading. The recorded exceedance cannot be attributed to construction activities at Westmead construction site as no off-site discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. The recorded values cannot also be related to the Parramatta water Treatment plant discharge either, as SW06 is upstream of EPL point 5. The exceedance can therefore be related to other nutrient sources, such as commercial, residential and or industrial activities occurring within the catchment of Parramatta River.

- **Exceedance twenty-one – SW07 to SW06 – December 2024 – Copper (dissolved)**

The copper levels recorded in the December 2024 sampling round for SW06 exceeded the ANZG 2018 criteria, while no exceedance was recorded at the upstream point SW07. The recorded exceedance is unlikely related to the construction activities being undertaken at the Westmead site given that that no offsite discharge has occurred from the Westmead water treatment plant for the duration of the monitoring period. The recorded numbers cannot also be related to the Parramatta water Treatment plant discharge as SW06 is upstream of EPL point 5 (Parramatta water treatment plant discharge point). The exceedance is likely related to other external environmental factors or industrial activities taking place along the waterway alignment.

- **Exceedance twenty-two – SW02 & SW08 to SW03– December 2024 – Copper (dissolved)**

Copper results from the December 2024 sampling round at SW03 were compared against baseline data. Baseline pre-construction data showed a continuous trend in copper (dissolved) levels exceeding the designated guidelines. Similarly copper exceedances were present at both upstream sampling locations SW02 and SW08 throughout the monitoring period. The results of the December 2024 sampling round were consistent with the baseline monitoring results indicating that elevated copper concentrations were not a result of construction activities.

- **Exceedance twenty-three – SW10 to SW07 – January 2025 – Turbidity (field)**

The turbidity levels recorded in the January 2025 sampling round are comparable to the baseline levels recorded at SW07. The corresponding NATA accredited lab results for both sampling locations SW07 and SW10 also returned turbidity results outside ANZG 2018 criteria (NTU = 2.3 and 3.1 respectively). It is unlikely that the low turbidity levels are related to the construction activities being undertaken at the Westmead site given that that no offsite discharge had occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance twenty-four – SW10 to SW07 – January 2025 – Dissolved Oxygen %**

The dissolved oxygen levels recorded in the January 2025 sampling round are comparable to the baseline levels recorded at SW07. The low dissolved oxygen levels are unlikely to be related to construction activities at the Westmead site given that that no offsite discharge had occurred from the Westmead water treatment plant for the duration of the monitoring period.

- **Exceedance twenty-five – SW07 to SW06 January 2025 – Turbidity (field)**

The turbidity levels recorded in the January 2024 sampling round are comparable to the baseline levels recorded at SW06. The corresponding NATA accredited lab results for both sampling locations returned turbidity results of SW07 = 2.3 and SW06 = 4.4, with SW07 being outside the ANZG 2018 criteria. The SW06 field turbidity reading can be related to higher water turbulence due to rainfall when the sample was collected compared to settled conditions when the sample was tested in the lab. While there is an exceedance of the SW06 criteria (field), the lab results are consistent with baseline lab results obtained for this area. It is unlikely that the high turbidity levels are related to the construction activities as there has been no discharge from the Westmead water treatment plant for the monitoring period and also because SW06 is upstream of the Parramatta water treatment plant discharge point.

- **Exceedance twenty-six – SW09 & SW01 to SW02 - January 2025 – Copper (dissolved)**

Copper results from the January 2025 sampling round were compared against baseline data which showed copper (dissolved) levels consistently exceeding the adopted assessment criteria. Similarly, copper exceedances were present at both upstream sampling locations SW09 and SW01 throughout the monitoring period. The results of the January 2025 sampling round were consistent with the elevated baseline copper concentrations which suggests these exceedances were unlikely caused by construction activities. This is further supported by the fact the Rosehill WTP discharge location is downstream of both sampling points, making it an unlikely contributor to the observed results.

- **Exceedance twenty-seven – SW01 to SW02– January 2025 – Zinc (dissolved)**

While the downstream zinc (dissolved) value was higher than the upstream value during the January 2025 monitoring event, this result was consistent with the baseline data, indicating that the elevated zinc (dissolved) concentration observed was not due to GLC construction activities but rather a product of natural variation in the environment or other influencing factors (i.e commercial/industrial sources). This is further supported by the fact the Rosehill WTP discharge location is downstream of both sampling points, making it an unlikely contributor to the observed results.

5.1.4 Step 4

‘If the exceedance is determined to be attributable to Project works, the event will be treated as an environmental incident and managed in accordance with the requirements of Section 3.10 of the CEMP’.

The in-depth review undertaken in Steps 1 – 3 concluded that none of the exceedances could be attributed to GLC construction works. As such, notification of an environmental incident is not required under Section 3.10 of the CEMP.

5.2 Recommendations

- Given the findings of the monitoring results to date and the continuation of the project, surface water quality monitoring will continue in accordance with the SWQMoP for the duration of construction.
- Annual review of the SWQMoP to ensure the SWQMoP captures the recommendations nominated in the 4th and 5th SWQ CMR.

6 CONCLUSION

Results obtained from this monitoring period indicate that there has not been a degradation of the surrounding surface water network due to construction of the WTP. The results are generally consistent with the adopted assessment criteria and pre-construction baseline water quality data, implying that any deviations from the adopted screening criteria are not attributed to GLC's construction activities.

ATTACHMENTS

Attachment 1 – Calibration Certificates

SERVICE & CALIBRATION REPORT
Water Quality Meter

Customer Details:	**Job Number**	**Date**
Gamuda Berhad (t/a Gamuda Australia Branch) Level 8/60 Station Street Parramatta NSW 2150 Attn: Hala Abedelhadi	240773	9/07/2024

Instrument Model:	**Instrument Serial Number:**
HORIBA U-52/2m Multi-Parameter Water Quality Meter	YMNSJKOF 2021

Fault Report

Requires service/calibration. Control unit battery cover broken and needs replacing.

Repairs Carried Out

Replaced DO membrane and refilled pH reference electrode. Replaced damaged battery cover. Re-calibrated all sensors as follows:

Calibration (in accordance with manufacturer's specifications):

Parameter - unit	Before Calibration	Calibration Value	After calibration	Comment
pH (pH)	6.72	7.01	7.01	Pass
pH (pH)	3.91	4.00	4.00	Pass
ORP (mV)	234	225	225	Pass
Conductivity (mS/cm)	0.000	0.000	0.000	Pass
Conductivity (mS/cm)	0.720	0.718	0.718	Pass
Conductivity (mS/cm)	6.48	6.67	6.67	Pass
Conductivity (mS/cm)	57.5	58.6	58.6	Pass
Turbidity (NTU)	0.0	0.0	0.0	Pass
Turbidity (NTU)	0.0	8.0	8.0	Pass
Turbidity (NTU)	96.1	80.0	80.0	Pass
Turbidity (NTU)	412	400	400	Pass
D.O. zero (mg/L)	0.18	0.00	0.00	Pass
D.O. span (mg/L)	11.09mg/L @ 19.8°C	9.32mg/L @19.8°C	9.32mg/L @19.8°C	Pass
Temperature (°C)	19.27	19.0	19.0	Pass

Sensors:

pH Glass Electrode	pH Ref Electrode	ORP Electrode	DO Electrode
133288	WD69NXBC	S6H1F5CC	UPCGGWJ0

Comments:

MAKE SURE the pH reference electrode is refilled with soln #330 regularly. If the #330 soln solidifies inside the pH reference electrode, remove the liquid junction cap (flat black rubber cap with wick in the middle) and rinse out the old solution with distilled water. Then refill with fresh HORIBA soln # 330 and refit the liquid junction cap. Please read the notes on pH maintenance.

Calibration carried out by:

Tim Adams

HORIBA U-50 & U-10 Series Water Quality Meters

IMPORTANT INFORMATION
REGARDING pH MAINTENANCE
(all operators of this equipment should read this note)

The pH reference electrode (the one with the flat black rubber cap with a dot in the middle about the size of a 5 cent coin) should be topped up regularly with potassium chloride (KCl) #330 internal electrolyte solution which is supplied with the U-50 equipment. Peel back the flat black rubber cap (liquid junction cap) by placing a fingernail under the edge and remove it. Then pour the #330 solution directly into the reservoir. Any excess may be washed off when the cap is replaced.

In the centre of the flat black rubber cap is a small porous wick (liquid junction) which allows the electrolyte to pass from the reference electrode into the sample. If this wick becomes clogged with dirt it will restrict the flow of electrolyte solution and adversely affect pH measurement.

If only the tip of the wick is clogged it is possible to push the wick further through the rubber cap and cut off say 1mm of the wick with a sharp blade to remove the dirty section.

The liquid junction cap is a replacement part and supplied in packs of two (2) . How often this needs changing will depend on the nature of the samples being measured. Water with oil or grease or high levels of suspended solids will clog the liquid junction (wick) more quickly than clean water samples.

If the reference solution in the chamber is not topped up regularly, the KCl solution may solidify or crystallize inside the chamber . This can be removed using a cotton bud, but be careful not to bend the pin which protrudes from the base of the reference electrode . When the old KCl solution has been removed , refill it with fresh KCl soln. Alternatively, the inside of the chamber can be rinsed out with distilled or deionised water using a laboratory wash bottle. DO NOT UNSCREW the whole pH reference electrode to do this simple maintenance .

It is a good idea to completely replace the internal electrolyte solution in the reference tip every 2-3 months. If this is done regularly then the KCl solution will not solidify and you should simply be able to remove the liquid junction cap, invert the probe and all the liquid will pour out. Then refill the reference electrode with fresh solution #330.

pH Glass Electrode

The pH glass electrode is the second part of the pH system. The pH glass electrode should be kept clean and moist during storage to maintain accurate readings and fast response time. The small black plastic storage cap on the pH glass electrode should be removed prior to use. After use, place a couple of drops of pH electrode storage soln or clean tap water in the small plastic cap and place the cap over the glass electrode.

The pH glass electrode will deteriorate more quickly if it is allowed to stay dry for long periods (weeks-months).

HORIBA U-50 & U-10 Series Water Quality Meters

IMPORTANT INFORMATION
REGARDING pH MAINTENANCE
(all operators of this equipment should read this note)

The pH reference electrode (the one with the flat black rubber cap with a dot in the middle about the size of a 5 cent coin) should be topped up regularly with potassium chloride (KCl) #330 internal electrolyte solution which is supplied with the U-50 equipment. Peel back the flat black rubber cap (liquid junction cap) by placing a fingernail under the edge and remove it. Then pour the #330 solution directly into the reservoir. Any excess may be washed off when the cap is replaced.

In the centre of the flat black rubber cap is a small porous wick (liquid junction) which allows the electrolyte to pass from the reference electrode into the sample. If this wick becomes clogged with dirt it will restrict the flow of electrolyte solution and adversely affect pH measurement.

If only the tip of the wick is clogged it is possible to push the wick further through the rubber cap and cut off say 1mm of the wick with a sharp blade to remove the dirty section.

The liquid junction cap is a replacement part and supplied in packs of two (2) . How often this needs changing will depend on the nature of the samples being measured. Water with oil or grease or high levels of suspended solids will clog the liquid junction (wick) more quickly than clean water samples.

If the reference solution in the chamber is not topped up regularly, the KCl solution may solidify or crystallize inside the chamber . This can be removed using a cotton bud, but be careful not to bend the pin which protrudes from the base of the reference electrode . When the old KCl solution has been removed , refill it with fresh KCl soln. Alternatively, the inside of the chamber can be rinsed out with distilled or deionised water using a laboratory wash bottle. DO NOT UNSCREW the whole pH reference electrode to do this simple maintenance .

It is a good idea to completely replace the internal electrolyte solution in the reference tip every 2-3 months. If this is done regularly then the KCl solution will not solidify and you should simply be able to remove the liquid junction cap, invert the probe and all the liquid will pour out. Then refill the reference electrode with fresh solution #330.

pH Glass Electrode

The pH glass electrode is the second part of the pH system. The pH glass electrode should be kept clean and moist during storage to maintain accurate readings and fast response time. The small black plastic storage cap on the pH glass electrode should be removed prior to use. After use, place a couple of drops of pH electrode storage soln or clean tap water in the small plastic cap and place the cap over the glass electrode.

The pH glass electrode will deteriorate more quickly if it is allowed to stay dry for long periods (weeks-months).

HORIBA Service Centre

Water Quality Meters

Australia

SERVICE & CALIBRATION REPORT
Water Quality Meter

Customer Details:	Job Number	Date
Gamuda Berhad Lvl 8, 60 Station Street Parramatta NSW 2150 Attn: Hala Abdelhadi	240741	30/07/2024

Instrument Model:	Instrument Serial Number:
HORIBA U-52/2m Multi-Parameter Water Quality Meter	L0H0MJB2 2015

Fault Report

Requires service/calibration

Repairs Carried Out

Replaced DO membrane. Replaced pH glass electrode. Refilled pH reference electrode. Cleaned all sensors (turbidity dirty). Re-calibrated all sensors as follows:

Calibration (in accordance with manufacturer's specifications):

Parameter - unit	Before Calibration	Calibration Value	After calibration	Comment
pH (pH)	6.92	7.01	7.01	Pass
pH (pH)	3.95	4.00	4.00	Pass
ORP (mV)	225	225	225	Pass
Conductivity (mS/cm)	0.000	0.000	0.000	Pass
Conductivity (mS/cm)	0.715	0.718	0.718	Pass
Conductivity (mS/cm)	6.62	6.67	6.67	Pass
Conductivity (mS/cm)	58.1	58.6	58.6	Pass
Turbidity (NTU)	0.0	0.0	0.0	Pass
Turbidity (NTU)	5.7	8.0	8.0	Pass
Turbidity (NTU)	83.1	80.0	80.0	Pass
Turbidity (NTU)	419	400	400	Pass
D.O. zero (mg/L)	0.00	0.00	0.00	Pass
D.O. span (mg/L)	7.78mg/L @ 21°C	9.12mg/L @21°C	9.12mg/L @21°C	Pass
Temperature (°C)	21.36°C	21.4°C	21.4°C	Pass

Sensors:

pH Glass Electrode	pH Ref Electrode	ORP Electrode	DO Electrode
(old) 242180	T02S53XH	YUCPLKWL	8N00GFBE
(new) 404050			

Comments:

MAKE SURE the pH reference electrode is refilled with HORIBA soln #330 regularly. If the #330 soln solidifies inside the pH reference electrode, remove the liquid junction cap (flat black rubber cap with wick in the middle) and rinse out the old solution with distilled water. Then refill with fresh HORIBA soln # 330 and refit the liquid junction cap. Please read the notes on pH maintenance.

Calibration carried out by:

Tony Fincher

CERTIFICATE OF ANALYSIS 358873

Client Details

Client	Gamuda Australia (t/a Gamuda Berhad)
Attention	Lochlan Browne
Address	Suite 26.01, 100 Miller Street, NORTH SYDNEY, NSW, 2060

Sample Details

Your Reference	**GAB/WTP/C&C/MSD/542 WTP-Surface Water Monitoring**
Number of Samples	11 Water
Date samples received	12/08/2024
Date completed instructions received	12/08/2024

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	19/08/2024
Date of Issue	19/08/2024

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Amanda Chui, LC/Air Toxics Supervisor
Giovanni Agosti, Group Technical Manager
Jenny He, Senior Chemist
Liam Timmins, Organics Supervisor
Timothy Toll, Senior Chemist

Authorised By
Nancy Zhang, Laboratory Manager

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell.
Inorg-019	Suspended Solids - determined gravimetricially by filtration of the sample. The samples are dried at 104+/-5°C.
Inorg-022	Turbidity - measured nephelometrically using a turbidimeter, in accordance with APHA latest edition, 2130-B.
Inorg-055	Nitrate - determined colourimetrically. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055	Nitrite - determined colourimetrically based on APHA latest edition NO2- B. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055/062/127	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen. Alternatively analysed by combustion and chemiluminescence.
Inorg-057	Ammonia - determined colourimetrically, based on APHA latest edition 4500-NH3 F. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a KCl extraction.
Inorg-060	Phosphate determined colourimetrically based on EPA365.1 and APHA latest edition 4500 P E. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-060	Total Phosphorus determined after persulphate digestion followed by colourimetric analysis.
Inorg-062	TKN - determined colourimetrically based on APHA latest edition 4500 Norg. Alternatively, TKN can be derived from calculation (Total N - NOx).
Inorg-118	Hexavalent Chromium (Cr6+) - determined firstly by separation using ion chromatography followed by the colourimetric analytical finish. Water samples are ideally field filtered into alkali preserved containers prior to receipt for dissolved Cr6+ analysis. Unfiltered water samples into alkali preserved containers (or pH adjusted to pH 8-9 on receipt) can be classified as Total (unfiltered) Cr6+. Please note, for 'Total/Unfiltered' Trivalent Chromium in waters [calculated], these results may be exaggerated due to the digestive limitation of 'Total/Unfiltered' Hexavalent Chromium in NaOH at pH 8-9 compared to more comprehensive digestion for Total Chromium using the mineral acids HNO3 and HCl. Solid (includes soils, filters, paints, swabs for example) samples are extracted in a buffered catalysed solution prior to the analytical finish above. Water extractable options are available (e.g. as an option for filters) on request. Impingers may need pH adjusting to pH 8-9 prior to IC-colourimetric analytical finish.
Metals-021	Determination of Mercury by Cold Vapour AAS.

Method ID	Methodology Summary
Metals-022	Determination of various metals by ICP-MS. Please note for Bromine and Iodine, any forms of these elements that are present are included together in the one result reported for each of these two elements. Salt forms (e.g. FeO, PbO, ZnO) are determined stoichiometrically from the base metal concentration.
Org-020	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-022/025	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS/GC-MSMS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-023	Water samples are analysed directly by purge and trap GC-MS.
Org-023	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-029	Soil samples are extracted with basified Methanol. Waters and soil extracts are directly injected and/or concentrated/extracted using SPE. TCLPs/ASLP leachates are centrifuged, the supernatant is then analysed (including amendment with solvent) - as per the option in AS4439.3. Analysis is undertaken with LC-MS/MS. PFAS results include the sum of branched and linear isomers where applicable. Please note that PFAS results are corrected for Extracted Internal Standards (QSM 5.4 Table B-15 terminology), which are mass labelled analytes added prior to sample preparation to assess matrix effects and verify processing of the sample. PFAS analytes without a commercially available mass labelled analogue are corrected vs a closely eluting mass labelled PFAS compound. Surrogates are also reported, in this context they are mass labelled PFAS compounds added prior to extraction but are used as monitoring compounds only (not used for result correction). Envicarb (or similar) is used discretionally to remove interfering matrix components. Please contact the laboratory if estimates of Measurement Uncertainty are required as per WA DER.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Where matrix spike recoveries fall below the lower limit of the acceptance criteria (e.g. for non-labile or standard Organics <60%), positive result(s) in the parent sample will subsequently have a higher than typical estimated uncertainty (MU estimates supplied on request) and in these circumstances the sample result is likely biased significantly low.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

Dissolved Metals: The preserved sample provided for #2 was not identified as either total or dissolved, therefore the unpreserved sample was filtered through 0.45µm filter at the lab.
Note: there is a possibility some elements may be underestimated.

Total Metals:
- The preserved sample provided for #2 was not identified as either total or dissolved, therefore the analysis was conducted from the unpreserved sample.
Note: there is a possibility some elements may be underestimated
- no unfiltered, preserved sample was received for #1, 3-11, therefore analysis was conducted from the unpreserved sample bottle.
Note: there is a possibility some elements may be underestimated.
- # Percent recovery is not applicable due to the high concentration of the element/s in the sample/s. However an acceptable recovery was obtained for the LCS.

CERTIFICATE OF ANALYSIS 362947

Client Details

Client	Gamuda Engineering
Attention	Scott Thompson
Address	Suite 26.01, 100 Miller Street, NORTH SYDNEY, NSW, 2060

Sample Details

Your Reference	**WTP - Surface Water Monitoring**
Number of Samples	8 Water
Date samples received	30/09/2024
Date completed instructions received	30/09/2024

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell.
Inorg-019	Suspended Solids - determined gravimetricially by filtration of the sample. The samples are dried at 104+/-5°C.
Inorg-022	Turbidity - measured nephelometrically using a turbidimeter, in accordance with APHA latest edition, 2130-B.
Inorg-055	Nitrate - determined colourimetrically. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055	Nitrite - determined colourimetrically based on APHA latest edition NO2- B. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055/062/127	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen. Alternatively analysed by combustion and chemiluminescence.
Inorg-057	Ammonia - determined colourimetrically, based on APHA latest edition 4500-NH3 F. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a KCl extraction.
Inorg-060	Phosphate determined colourimetrically based on EPA365.1 and APHA latest edition 4500 P E. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-062	TKN - determined colourimetrically based on APHA latest edition 4500 Norg. Alternatively, TKN can be derived from calculation (Total N - NOx).
Inorg-118	Hexavalent Chromium (Cr6+) - determined firstly by separation using ion chromatography followed by the colourimetric analytical finish. Water samples are ideally field filtered into alkali preserved containers prior to receipt for dissolved Cr6+ analysis. Unfiltered water samples into alkali preserved containers (or pH adjusted to pH 8-9 on receipt) can be classified as Total (unfiltered) Cr6+. Please note, for 'Total/Unfiltered' Trivalent Chromium in waters [calculated], these results may be exaggerated due to the digestive limitation of 'Total/Unfiltered' Hexavalent Chromium in NaOH at pH 8-9 compared to more comprehensive digestion for Total Chromium using the mineral acids HNO3 and HCl. Solid (includes soils, filters, paints, swabs for example) samples are extracted in a buffered catalysed solution prior to the analytical finish above. Water extractable options are available (e.g. as an option for filters) on request. Impingers may need pH adjusting to pH 8-9 prior to IC-colourimetric analytical finish.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.

Method ID	Methodology Summary
Metals-022	Determination of various metals by ICP-MS. Please note for Bromine and Iodine, any forms of these elements that are present are included together in the one result reported for each of these two elements. Salt forms (e.g. FeO, PbO, ZnO) are determined stoichiometrically from the base metal concentration.
Org-020	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-022/025	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS/GC-MSMS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-023	Water samples are analysed directly by purge and trap GC-MS.
Org-023	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-029	Soil samples are extracted with basified Methanol. Waters and soil extracts are directly injected and/or concentrated/extracted using SPE. TCLPs/ASLP leachates are centrifuged, the supernatant is then analysed (including amendment with solvent) - as per the option in AS4439.3. Analysis is undertaken with LC-MS/MS. PFAS results include the sum of branched and linear isomers where applicable. Please note that PFAS results are corrected for Extracted Internal Standards (QSM 5.4 Table B-15 terminology), which are mass labelled analytes added prior to sample preparation to assess matrix effects and verify processing of the sample. PFAS analytes without a commercially available mass labelled analogue are corrected vs a closely eluting mass labelled PFAS compound. Surrogates are also reported, in this context they are mass labelled PFAS compounds added prior to extraction but are used as monitoring compounds only (not used for result correction). Envicarb (or similar) is used discretionally to remove interfering matrix components. Please contact the laboratory if estimates of Measurement Uncertainty are required as per WA DER.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Where matrix spike recoveries fall below the lower limit of the acceptance criteria (e.g. for non-labile or standard Organics <60%), positive result(s) in the parent sample will subsequently have a higher than typical estimated uncertainty (MU estimates supplied on request) and in these circumstances the sample result is likely biased significantly low.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

All metals in water - total - # Percent recovery is not applicable due to the high concentration of the elements in the samples. However an acceptable recovery was obtained for the LCS.

For PFAS Extracted Internal Standards denoted with # or outside the 50-150% acceptance range, the respective target analyte results may be unaffected, in other circumstances the PQL has been raised to accommodate the outlier(s).

MISC_INORG:TSS:PQL has been raised due to the small volume of sample supplied.

CERTIFICATE OF ANALYSIS 365289

Client Details

Client	Gamuda Engineering
Attention	Daniel Shutt
Address	Suite 26.01, 100 Miller Street, NORTH SYDNEY, NSW, 2060

Sample Details

Your Reference	**WTP - Surface Water Monitoring**
Number of Samples	9 Water
Date samples received	31/10/2024
Date completed instructions received	31/10/2024

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	08/11/2024

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell.
Inorg-019	Suspended Solids - determined gravimetricially by filtration of the sample. The samples are dried at 104+/-5°C.
Inorg-022	Turbidity - measured nephelometrically using a turbidimeter, in accordance with APHA latest edition, 2130-B.
Inorg-055	Nitrate - determined colourimetrically. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055	Nitrite - determined colourimetrically based on APHA latest edition NO2- B. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055/062/127	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen. Alternatively analysed by combustion and chemiluminescence.
Inorg-057	Ammonia - determined colourimetrically, based on APHA latest edition 4500-NH3 F. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a KCl extraction.
Inorg-060	Phosphate determined colourimetrically based on EPA365.1 and APHA latest edition 4500 P E. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-062	TKN - determined colourimetrically based on APHA latest edition 4500 Norg. Alternatively, TKN can be derived from calculation (Total N - NOx).
Inorg-118	Hexavalent Chromium (Cr6+) - determined firstly by separation using ion chromatography followed by the colourimetric analytical finish. Water samples are ideally field filtered into alkali preserved containers prior to receipt for dissolved Cr6+ analysis. Unfiltered water samples into alkali preserved containers (or pH adjusted to pH 8-9 on receipt) can be classified as Total (unfiltered) Cr6+. Please note, for 'Total/Unfiltered' Trivalent Chromium in waters [calculated], these results may be exaggerated due to the digestive limitation of 'Total/Unfiltered' Hexavalent Chromium in NaOH at pH 8-9 compared to more comprehensive digestion for Total Chromium using the mineral acids HNO3 and HCl. Solid (includes soils, filters, paints, swabs for example) samples are extracted in a buffered catalysed solution prior to the analytical finish above. Water extractable options are available (e.g. as an option for filters) on request. Impingers may need pH adjusting to pH 8-9 prior to IC-colourimetric analytical finish.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.

Method ID	Methodology Summary
Metals-022	Determination of various metals by ICP-MS. Please note for Bromine and Iodine, any forms of these elements that are present are included together in the one result reported for each of these two elements. Salt forms (e.g. FeO, PbO, ZnO) are determined stoichiometrically from the base metal concentration.
Org-020	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-022/025	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS/GC-MSMS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-023	Water samples are analysed directly by purge and trap GC-MS.
Org-023	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-029	Soil samples are extracted with basified Methanol. Waters and soil extracts are directly injected and/or concentrated/extracted using SPE. TCLPs/ASLP leachates are centrifuged, the supernatant is then analysed (including amendment with solvent) - as per the option in AS4439.3. Analysis is undertaken with LC-MS/MS. PFAS results include the sum of branched and linear isomers where applicable. Please note that PFAS results are corrected for Extracted Internal Standards (QSM 5.4 Table B-15 terminology), which are mass labelled analytes added prior to sample preparation to assess matrix effects and verify processing of the sample. PFAS analytes without a commercially available mass labelled analogue are corrected vs a closely eluting mass labelled PFAS compound. Surrogates are also reported, in this context they are mass labelled PFAS compounds added prior to extraction but are used as monitoring compounds only (not used for result correction). Envicarb (or similar) is used discretionally to remove interfering matrix components. Please contact the laboratory if estimates of Measurement Uncertainty are required as per WA DER.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Where matrix spike recoveries fall below the lower limit of the acceptance criteria (e.g. for non-labile or standard Organics <60%), positive result(s) in the parent sample will subsequently have a higher than typical estimated uncertainty (MU estimates supplied on request) and in these circumstances the sample result is likely biased significantly low.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

Total metals: no unfiltered, preserved sample was received, therefore analysis was conducted from the unpreserved sample bottle. Note: there is a possibility some elements may be underestimated.

For PFAS Extracted Internal Standards denoted with # or outside the 50-150% acceptance range, the respective target analyte results may be unaffected, in other circumstances the PQL has been raised to accommodate the outlier(s).

TSS:PQL has been raised due to the small volume of sample supplied.

CERTIFICATE OF ANALYSIS 367012

Client Details

Client	Gamuda Engineering
Attention	Kellie Hunt
Address	Suite 26.01, 100 Miller Street, NORTH SYDNEY, NSW, 2060

Sample Details

Your Reference	**WTP - Surface Water Monitoring**
Number of Samples	9 Water
Date samples received	21/11/2024
Date completed instructions received	21/11/2024

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	29/11/2024
Date of Issue	29/11/2024

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Diego Bigolin, Inorganics Supervisor
Dragana Tomas, Senior Chemist

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell.
Inorg-019	Suspended Solids - determined gravimetricially by filtration of the sample. The samples are dried at 104+/-5°C.
Inorg-022	Turbidity - measured nephelometrically using a turbidimeter, in accordance with APHA latest edition, 2130-B.
Inorg-055	Nitrate - determined colourimetrically. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055	Nitrite - determined colourimetrically based on APHA latest edition NO2- B. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055/062/127	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen. Alternatively analysed by combustion and chemiluminescence.
Inorg-057	Ammonia - determined colourimetrically, based on APHA latest edition 4500-NH3 F. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a KCl extraction.
Inorg-060	Phosphate determined colourimetrically based on EPA365.1 and APHA latest edition 4500 P E. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-062	TKN - determined colourimetrically based on APHA latest edition 4500 Norg. Alternatively, TKN can be derived from calculation (Total N - NOx).
Inorg-118	Hexavalent Chromium (Cr6+) - determined firstly by separation using ion chromatography followed by the colourimetric analytical finish. Water samples are ideally field filtered into alkali preserved containers prior to receipt for dissolved Cr6+ analysis. Unfiltered water samples into alkali preserved containers (or pH adjusted to pH 8-9 on receipt) can be classified as Total (unfiltered) Cr6+. Please note, for 'Total/Unfiltered' Trivalent Chromium in waters [calculated], these results may be exaggerated due to the digestive limitation of 'Total/Unfiltered' Hexavalent Chromium in NaOH at pH 8-9 compared to more comprehensive digestion for Total Chromium using the mineral acids HNO3 and HCl. Solid (includes soils, filters, paints, swabs for example) samples are extracted in a buffered catalysed solution prior to the analytical finish above. Water extractable options are available (e.g. as an option for filters) on request. Impingers may need pH adjusting to pH 8-9 prior to IC-colourimetric analytical finish.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.

Method ID	Methodology Summary
Metals-022	Determination of various metals by ICP-MS. Please note for Bromine and Iodine, any forms of these elements that are present are included together in the one result reported for each of these two elements. Salt forms (e.g. FeO, PbO, ZnO) are determined stoichiometrically from the base metal concentration.
Org-020	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-022/025	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS/GC-MSMS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-023	Water samples are analysed directly by purge and trap GC-MS.
Org-023	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-029	Soil samples are extracted with basified Methanol. Waters and soil extracts are directly injected and/or concentrated/extracted using SPE. TCLPs/ASLP leachates are centrifuged, the supernatant is then analysed (including amendment with solvent) - as per the option in AS4439.3. Analysis is undertaken with LC-MS/MS. PFAS results include the sum of branched and linear isomers where applicable. Please note that PFAS results are corrected for Extracted Internal Standards (QSM 5.4 Table B-15 terminology), which are mass labelled analytes added prior to sample preparation to assess matrix effects and verify processing of the sample. PFAS analytes without a commercially available mass labelled analogue are corrected vs a closely eluting mass labelled PFAS compound. Surrogates are also reported, in this context they are mass labelled PFAS compounds added prior to extraction but are used as monitoring compounds only (not used for result correction). Envicarb (or similar) is used discretionally to remove interfering matrix components. Please contact the laboratory if estimates of Measurement Uncertainty are required as per WA DER.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Where matrix spike recoveries fall below the lower limit of the acceptance criteria (e.g. for non-labile or standard Organics <60%), positive result(s) in the parent sample will subsequently have a higher than typical estimated uncertainty (MU estimates supplied on request) and in these circumstances the sample result is likely biased significantly low.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

8 Metals in Waters - total - The PQL has been raised 2 times for #3 due to suppression of the internal standard, which required the samples to be diluted. This is likely due to the high level of salts in the sample.

CERTIFICATE OF ANALYSIS 369151

Client Details

Client	Gamuda Engineering
Attention	Lochlan Browne
Address	Suite 26.01, 100 Miller Street, NORTH SYDNEY, NSW, 2060

Sample Details

Your Reference	**WTP - Surface Water Monitoring**
Number of Samples	9 Water
Date samples received	16/12/2024
Date completed instructions received	16/12/2024

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Please refer to the last page of this report for any comments relating to the results.

Report Details

Date results requested by	02/01/2025
Date of Issue	30/12/2024

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Dragana Tomas, Senior Chemist
Jack Wallis, Senior Chemist
Loren Bardwell, Development Chemist
Nick Sarlamis, Assistant Operation Manager
Sean McAlary, Senior Chemist
Tabitha Roberts, Senior Chemist
Timothy Toll, Senior Chemist

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell.
Inorg-019	Suspended Solids - determined gravimetricially by filtration of the sample. The samples are dried at 104+/-5°C.
Inorg-022	Turbidity - measured nephelometrically using a turbidimeter, in accordance with APHA latest edition, 2130-B.
Inorg-055	Nitrate - determined colourimetrically. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055	Nitrite - determined colourimetrically based on APHA latest edition NO2- B. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055/062/127	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen. Alternatively analysed by combustion and chemiluminescence.
Inorg-057	Ammonia - determined colourimetrically, based on APHA latest edition 4500-NH3 F. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a KCl extraction.
Inorg-060	Phosphate determined colourimetrically based on EPA365.1 and APHA latest edition 4500 P E. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-062	TKN - determined colourimetrically based on APHA latest edition 4500 Norg. Alternatively, TKN can be derived from calculation (Total N - NOx).
Inorg-118	Hexavalent Chromium (Cr6+) - determined firstly by separation using ion chromatography followed by the colourimetric analytical finish. Water samples are ideally field filtered into alkali preserved containers prior to receipt for dissolved Cr6+ analysis. Unfiltered water samples into alkali preserved containers (or pH adjusted to pH 8-9 on receipt) can be classified as Total (unfiltered) Cr6+. Please note, for 'Total/Unfiltered' Trivalent Chromium in waters [calculated], these results may be exaggerated due to the digestive limitation of 'Total/Unfiltered' Hexavalent Chromium in NaOH at pH 8-9 compared to more comprehensive digestion for Total Chromium using the mineral acids HNO3 and HCl. Solid (includes soils, filters, paints, swabs for example) samples are extracted in a buffered catalysed solution prior to the analytical finish above. Water extractable options are available (e.g. as an option for filters) on request. Impingers may need pH adjusting to pH 8-9 prior to IC-colourimetric analytical finish.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.

Method ID	Methodology Summary
Metals-022	Determination of various metals by ICP-MS. Please note for Bromine and Iodine, any forms of these elements that are present are included together in the one result reported for each of these two elements. Salt forms (e.g. FeO, PbO, ZnO) are determined stoichiometrically from the base metal concentration.
Org-020	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-022/025	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS/GC-MSMS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-023	Water samples are analysed directly by purge and trap GC-MS.
Org-023	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-029	Soil samples are extracted with basified Methanol. Waters and soil extracts are directly injected and/or concentrated/extracted using SPE. TCLPs/ASLP leachates are centrifuged, the supernatant is then analysed (including amendment with solvent) - as per the option in AS4439.3. Analysis is undertaken with LC-MS/MS. PFAS results include the sum of branched and linear isomers where applicable. Please note that PFAS results are corrected for Extracted Internal Standards (QSM 5.4 Table B-15 terminology), which are mass labelled analytes added prior to sample preparation to assess matrix effects and verify processing of the sample. PFAS analytes without a commercially available mass labelled analogue are corrected vs a closely eluting mass labelled PFAS compound. Surrogates are also reported, in this context they are mass labelled PFAS compounds added prior to extraction but are used as monitoring compounds only (not used for result correction). Envicarb (or similar) is used discretionally to remove interfering matrix components. Please contact the laboratory if estimates of Measurement Uncertainty are required as per WA DER.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Where matrix spike recoveries fall below the lower limit of the acceptance criteria (e.g. for non-labile or standard Organics <60%), positive result(s) in the parent sample will subsequently have a higher than typical estimated uncertainty (MU estimates supplied on request) and in these circumstances the sample result is likely biased significantly low.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Report Comments

Total metals: no unfiltered, preserved sample was received, therefore analysis was conducted from the unpreserved sample bottle. Note: there is a possibility some elements may be underestimated.

TRH_BTEX_W_V_NEPM:Samples 2,3,6,9 have headspace.

CERTIFICATE OF ANALYSIS 370423

Client Details

Client	Gamuda Engineering
Attention	Tahli moore
Address	Suite 26.01, 100 Miller Street, NORTH SYDNEY, NSW, 2060

Sample Details

Your Reference	**WTP - Surface Water Monitoring**
Number of Samples	9 Water
Date samples received	14/01/2025
Date completed instructions received	14/01/2025

Analysis Details

Please refer to the following pages for results, methodology summary and quality control data.

Samples were analysed as received from the client. Results relate specifically to the samples as received.

Results are reported on a dry weight basis for solids and on an as received basis for other matrices.

Report Details

Date results requested by	21/01/2025
Date of Issue	21/01/2025

NATA Accreditation Number 2901. This document shall not be reproduced except in full.

Accredited for compliance with ISO/IEC 17025 - Testing. **Tests not covered by NATA are denoted with ***

Results Approved By
Diego Bigolin, Inorganics Supervisor

Method ID	Methodology Summary
Inorg-001	pH - Measured using pH meter and electrode. Please note that the results for water analyses are indicative only, as analysis outside of the APHA storage times.
Inorg-002	Conductivity and Salinity - measured using a conductivity cell.
Inorg-019	Suspended Solids - determined gravimetricially by filtration of the sample. The samples are dried at 104+/-5°C.
Inorg-022	Turbidity - measured nephelometrically using a turbidimeter, in accordance with APHA latest edition, 2130-B.
Inorg-055	Nitrate - determined colourimetrically. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055	Nitrite - determined colourimetrically based on APHA latest edition NO2- B. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-055/062/127	Total Nitrogen - Calculation sum of TKN and oxidised Nitrogen. Alternatively analysed by combustion and chemiluminescence.
Inorg-057	Ammonia - determined colourimetrically, based on APHA latest edition 4500-NH3 F. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a KCl extraction.
Inorg-060	Phosphate determined colourimetrically based on EPA365.1 and APHA latest edition 4500 P E. Waters samples are filtered on receipt prior to analysis. Soils are analysed following a water extraction.
Inorg-062	TKN - determined colourimetrically based on APHA latest edition 4500 Norg. Alternatively, TKN can be derived from calculation (Total N - NOx).
Inorg-118	Hexavalent Chromium (Cr6+) - determined firstly by separation using ion chromatography followed by the colourimetric analytical finish. Water samples are ideally field filtered into alkali preserved containers prior to receipt for dissolved Cr6+ analysis. Unfiltered water samples into alkali preserved containers (or pH adjusted to pH 8-9 on receipt) can be classified as Total (unfiltered) Cr6+. Please note, for 'Total/Unfiltered' Trivalent Chromium in waters [calculated], these results may be exaggerated due to the digestive limitation of 'Total/Unfiltered' Hexavalent Chromium in NaOH at pH 8-9 compared to more comprehensive digestion for Total Chromium using the mineral acids HNO3 and HCl. Solid (includes soils, filters, paints, swabs for example) samples are extracted in a buffered catalysed solution prior to the analytical finish above. Water extractable options are available (e.g. as an option for filters) on request. Impingers may need pH adjusting to pH 8-9 prior to IC-colourimetric analytical finish.
Metals-020	Determination of various metals by ICP-AES.
Metals-021	Determination of Mercury by Cold Vapour AAS.

Method ID	Methodology Summary
Metals-022	Determination of various metals by ICP-MS. Please note for Bromine and Iodine, any forms of these elements that are present are included together in the one result reported for each of these two elements. Salt forms (e.g. FeO, PbO, ZnO) are determined stoichiometrically from the base metal concentration.
Org-020	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-FID. F2 = (>C10-C16)-Naphthalene as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater (HSLs Tables 1A (3, 4)). Note Naphthalene is determined from the VOC analysis.
Org-022/025	Soil samples are extracted with Dichloromethane/Acetone and waters with Dichloromethane and analysed by GC-MS/GC-MSMS. Benzo(a)pyrene TEQ as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater - 2013.
Org-023	Water samples are analysed directly by purge and trap GC-MS.
Org-023	Soil samples are extracted with methanol and spiked into water prior to analysing by purge and trap GC-MS. Water samples are analysed directly by purge and trap GC-MS. F1 = (C6-C10)-BTEX as per NEPM B1 Guideline on Investigation Levels for Soil and Groundwater.
Org-029	Soil samples are extracted with basified Methanol. Waters and soil extracts are directly injected and/or concentrated/extracted using SPE. TCLPs/ASLP leachates are centrifuged, the supernatant is then analysed (including amendment with solvent) - as per the option in AS4439.3. Analysis is undertaken with LC-MS/MS. PFAS results include the sum of branched and linear isomers where applicable. Please note that PFAS results are corrected for Extracted Internal Standards (QSM 5.4 Table B-15 terminology), which are mass labelled analytes added prior to sample preparation to assess matrix effects and verify processing of the sample. PFAS analytes without a commercially available mass labelled analogue are corrected vs a closely eluting mass labelled PFAS compound. Surrogates are also reported, in this context they are mass labelled PFAS compounds added prior to extraction but are used as monitoring compounds only (not used for result correction). Envicarb (or similar) is used discretionally to remove interfering matrix components. Please contact the laboratory if estimates of Measurement Uncertainty are required as per WA DER.

Result Definitions

NT	Not tested
NA	Test not required
INS	Insufficient sample for this test
PQL	Practical Quantitation Limit
<	Less than
>	Greater than
RPD	Relative Percent Difference
LCS	Laboratory Control Sample
NS	Not specified
NEPM	National Environmental Protection Measure
NR	Not Reported

Quality Control Definitions

Blank	This is the component of the analytical signal which is not derived from the sample but from reagents, glassware etc, can be determined by processing solvents and reagents in exactly the same manner as for samples.
Duplicate	This is the complete duplicate analysis of a sample from the process batch. If possible, the sample selected should be one where the analyte concentration is easily measurable.
Matrix Spike	A portion of the sample is spiked with a known concentration of target analyte. The purpose of the matrix spike is to monitor the performance of the analytical method used and to determine whether matrix interferences exist.
LCS (Laboratory Control Sample)	This comprises either a standard reference material or a control matrix (such as a blank sand or water) fortified with analytes representative of the analyte class. It is simply a check sample.
Surrogate Spike	Surrogates are known additions to each sample, blank, matrix spike and LCS in a batch, of compounds which are similar to the analyte of interest, however are not expected to be found in real samples.

Australian Drinking Water Guidelines recommend that Thermotolerant Coliform, Faecal Enterococci, & E.Coli levels are less than 1cfu/100mL. The recommended maximums are taken from "Australian Drinking Water Guidelines", published by NHMRC & ARMC 2011.

The recommended maximums for analytes in urine are taken from “2018 TLVs and BEIs”, as published by ACGIH (where available). Limit provided for Nickel is a precautionary guideline as per Position Paper prepared by AIOH Exposure Standards Committee, 2016.

Guideline limits for Rinse Water Quality reported as per analytical requirements and specifications of AS 4187, Amdt 2 2019, Table 7.2

Laboratory Acceptance Criteria

Duplicate sample and matrix spike recoveries may not be reported on smaller jobs, however, were analysed at a frequency to meet or exceed NEPM requirements. All samples are tested in batches of 20. The duplicate sample RPD and matrix spike recoveries for the batch were within the laboratory acceptance criteria.

Filters, swabs, wipes, tubes and badges will not have duplicate data as the whole sample is generally extracted during sample extraction.

Spikes for Physical and Aggregate Tests are not applicable.

For VOCs in water samples, three vials are required for duplicate or spike analysis.

Duplicates: >10xPQL - RPD acceptance criteria will vary depending on the analytes and the analytical techniques but is typically in the range 20%-50% – see ELN-P05 QA/QC tables for details; <10xPQL - RPD are higher as the results approach PQL and the estimated measurement uncertainty will statistically increase.

Matrix Spikes, LCS and Surrogate recoveries: Generally 70-130% for inorganics/metals (not SPOCAS); 60-140% for organics/SPOCAS (+/-50% surrogates) and 10-140% for labile SVOCs (including labile surrogates), ultra trace organics and speciated phenols is acceptable.

In circumstances where no duplicate and/or sample spike has been reported at 1 in 10 and/or 1 in 20 samples respectively, the sample volume submitted was insufficient in order to satisfy laboratory QA/QC protocols.

When samples are received where certain analytes are outside of recommended technical holding times (THTs), the analysis has proceeded. Where analytes are on the verge of breaching THTs, every effort will be made to analyse within the THT or as soon as practicable.

Where sampling dates are not provided, Envirolab are not in a position to comment on the validity of the analysis where recommended technical holding times may have been breached.

Where matrix spike recoveries fall below the lower limit of the acceptance criteria (e.g. for non-labile or standard Organics <60%), positive result(s) in the parent sample will subsequently have a higher than typical estimated uncertainty (MU estimates supplied on request) and in these circumstances the sample result is likely biased significantly low.

Measurement Uncertainty estimates are available for most tests upon request.

Analysis of aqueous samples typically involves the extraction/digestion and/or analysis of the liquid phase only (i.e. NOT any settled sediment phase but inclusive of suspended particles if present), unless stipulated on the Envirolab COC and/or by correspondence. Notable exceptions include certain Physical Tests (pH/EC/BOD/COD/Apparent Colour etc.), Solids testing, total recoverable metals and PFAS where solids are included by default.

Samples for Microbiological analysis (not Amoeba forms) received outside of the 2-8°C temperature range do not meet the ideal cooling conditions as stated in AS2031-2012.

Attachment C – Groundwater Monitoring Report

Groundwater Monitoring Six Monthly Report 5

Sydney Metro West – Western Tunnelling Package

20 July 2024 to 19 January 2025

ISSUE DATE: APRIL 2025

Document Details

Document Title	**Groundwater Monitoring Six Monthly Report 5**
Project Name	**Sydney Metro West – Western Tunnelling Package**
Client	**Sydney Metro**
GA Project No.	**00013/13065**
Document Reference No.	**SMWSTWTP-GLO-1NL-EN-RPT-000016**
Principal Contractor	**Gamuda Engineering (Australia)**
ABN	**36 636 433 522**
Project Address	**L8, 60 Station Street, Parramatta NSW 2150**

WHS	Work Health and Safety Management
WTP	Western Tunnelling Package (The Project)

1 INTRODUCTION

Project Description

Sydney Metro West (SMW) is a new underground railway connecting Greater Parramatta and the Sydney CBD. It will provide fast connections between greater Sydney's two major business centres as well as providing better access to the growing business and entertainment precincts in Olympic Park and Pyrmont, the health and medical research hub at Westmead and the future business and tourism site at The Bays.

An Environmental Impact Statement (EIS) (Jacobs/Arcadis, 2020) for the Concept and Stage 1 assessed the groundwater impacts in response to the Secretary Environmental Assessment Requirements issued by the NSW Department of Planning, Housing, and Infrastructure (DPHI). The Project was approved on 11 March 2021 (SSI 10038).

Sydney Metro is delivering the Sydney Metro West project via several different packages, including the Western Tunnelling Package (WTP, the Project). Figure 1 is an overview map outlining the extent of the Project.

1.1 Groundwater Monitoring Objective

The objective of the six-monthly groundwater monitoring report is to ensure that impacts to groundwater over the monitoring period (20 July 2024 to 19 January 2025) are minimised during construction of the Western Tunnelling Package (WTP). Additionally, the report aims to ensure that all works are undertaken in compliance with the project requirements detailed in the Groundwater Monitoring Program (SMWSTWTP-GLO-1NL-EN-PRG-000002, Rev. D) and the Groundwater Management Plan (SMWSTWTP-GLO-1NL-EN-PLN-000002, Rev. D).

This report combines results from the groundwater monitoring and sampling events completed by Epic Environmental (Epic), and results from the Water Treatment Plant testing completed by Gamuda Australia – Laing O'Rourke Consortium (GLC). This report details the results from the reporting period 20 July 2024 to 19 January 2025.

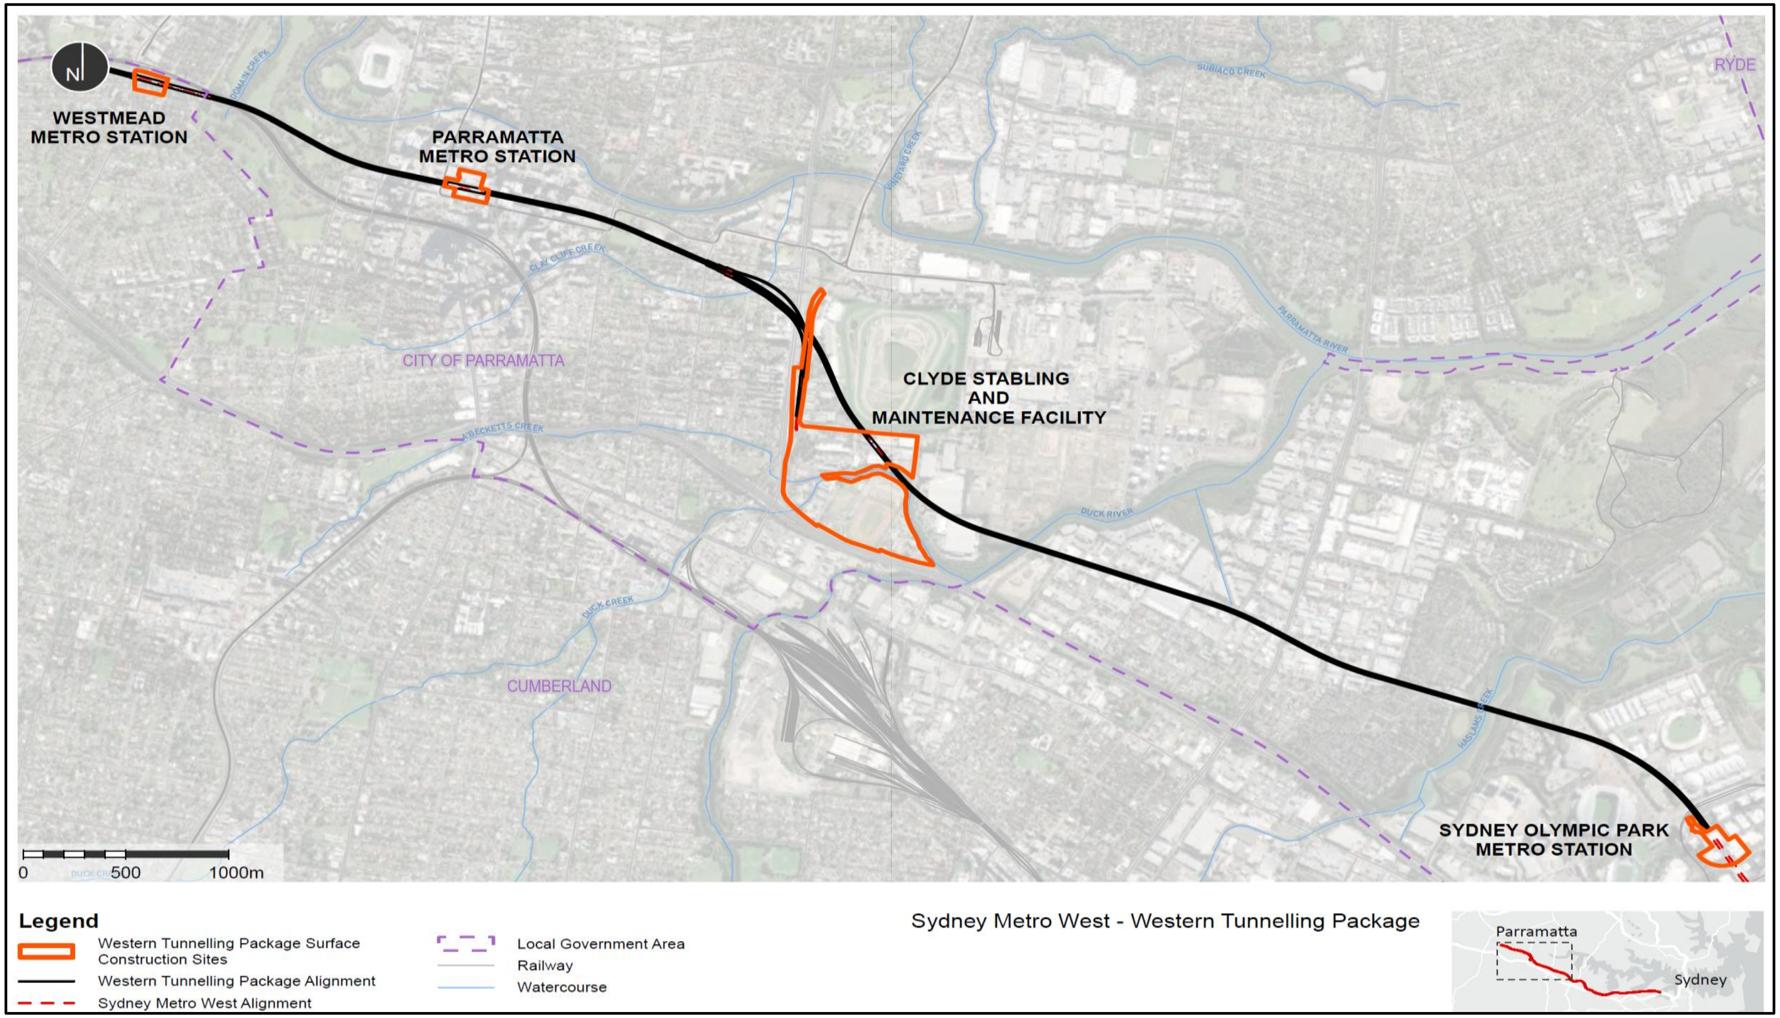

Figure 1 WTP Project Map Overview

1.2 Project Requirements

The Groundwater Monitoring Program (GMP) sets out the requirement to develop and issue a Groundwater Monitoring Report (this report), collating groundwater monitoring data. This report collates groundwater monitoring undertaken during the previous six months of construction, from 20 July 2024 to 19 January 2025. Groundwater monitoring event (GME) data from August 2024 and October 2024 are included within this report.

The Project requirements relevant to the preparation of this Groundwater Monitoring Report are identified in **Table 1**. A document reference is also included to indicate where the requirement is addressed in this Groundwater Monitoring Report or other documents. Additional monitoring requirements outlined in the GMP and in the Groundwater Management Plan (GWMP) are also listed in **Table 1**.

Table 1 Monitoring Report and Compliance Matrix

Reference	Requirement	Document Reference
Condition of Approval (MCoA) C23	The results of the Construction Monitoring Programs must be submitted to the Planning Secretary, ER and relevant regulatory agencies, for information in the form of a Construction Monitoring Report at the frequency identified in the relevant Construction Monitoring Program.	This document
Revised Environmental Mitigation Measure (REMM) GW3	Additional site investigations would be carried out at creeks or surface water bodies where the additional data review in GW2 shows there is a likely surface water/groundwater interaction. This would involve baseline monitoring of creek flows (streamflow gauging) prior to construction, and baseflow streamflow analysis to confirm the existing groundwater baseflow contribution to streamflow for each creek. Where a significant reduction in baseflow is predicted due to Stage 1, design responses would be implemented at station and shaft excavations to reduce potential baseflow loss.	Surface water monitoring report
REMM GW4	Monitoring of groundwater levels and quality at the site area would occur before, during and after construction. This would also include monitoring of potential contaminants of concern. Groundwater level data would be regularly reviewed during and after construction by a qualified hydrogeologist. Groundwater monitoring data would be provided to the NSW Environment Protection Authority and Department of Planning, Industry, Environment, Water and the Natural Resources Access Regulator for information.	This document (Section 5)
Groundwater Monitoring Program (SMWSTWTP-GLO-1NL-EN-PRG-000002)	Pressure transducers with digital dataloggers will be installed (or maintained from the baseline monitoring phase) in selected standpipe piezometers within and around the predicted radius of drawdown for the project to provide continuous data collection. The dataloggers will be programmed to record at hourly intervals.	Section 5.3
	Selected standpipe piezometers will include transducers with fitted with EC sensors to record groundwater salinity for monitoring of potential saline intrusion where potential risks exist.	Section 3.1.1 and 5.3.2
	All pressure transducers will be set at a depth lower than the predicted minimum water table elevation, accounting for natural variations and artificially induced drawdown. Any transducers with EC sensors shall be set within the screened interval for accurate assessment of groundwater salinity. Data loggers will be checked and maintained as necessary before being re-calibrated, decontaminated and then returned to the monitoring bore at a known depth below the top of casing.	Section 5.3 and Appendix C – Hydrographs

Reference	Requirement	Document Reference
	The static groundwater level will be measured and recorded at each standpipe piezometer each month using an oil/water interface probe to verify the continuous data recorded by dataloggers and identify any non-aqueous phase liquid (NAPL) contamination.	Section 5.3.1
	Recorded data will be compensated for barometric pressure and converted to a groundwater level measurement. Measurements will be recorded in metres below top of casing (mbTOC) and converted to metres below ground level (mBGL) and metres Australian Height Datum (mAHD).	Appendix C – Hydrographs
	Groundwater monitoring will be overseen by personnel with appropriate qualifications and experience. Trained field personnel will complete monitoring rounds using appropriate personal protective equipment (PPE) and calibrated monitoring equipment.	Section 3
	All groundwater level data will be compared to local rainfall records to assess recharge response and identify any potential adverse effects from construction activities.	Appendix C – Hydrographs
	In accordance with the Aquifer Interference Policy (AIP) minimal impact considerations, groundwater level and pore pressures will be assessed against the following criteria where appropriate (DPI-Water, 2012): • Less than or equal to 10 % cumulative variation in the water table, allowing for typical climatic “post-water sharing plan” variations, 40 m from any: – high priority groundwater dependent ecosystem; or – high priority culturally significant site listed in the schedule of the relevant water sharing plan. A cumulative maximum of 2 m decline in water level or pore pressure at any water supply bore	Section 5.3.2
	Groundwater quality monitoring will be undertaken as an initial event prior to construction and on a quarterly (3 month) basis thereafter.	Section 3
	The quarterly sampling will test for all parameters tested in the baseline monitoring report, to provide ongoing monitoring of groundwater conditions and assess any potential changes in groundwater quality which may have occurred as a result of the construction activities or other local events.	Section 3
	Sampling frequencies for water quality parameters will be increased to monthly sampling in the event that laboratory testing results identify any exceedances of the trigger values from the initial baseline monitoring event or during quarterly sampling round. The NEPM (2013) GILs and ANZG (2018) DGVs for 95% and 99% species protection have been adopted as trigger values on which monthly sampling requirements will be based.	Section 5.5.1
	Dedicated dataloggers with specifications allowing the measurement of pressure, temperature, and electrical conductivity (EC) will be installed in selected monitoring bores. Electrical conductivity (EC) results will be assessed to detect changes in water quality that may indicate the intrusion of saline water towards the station boxes and shafts.	Section 3.1.1 Section 5.3.2
	The groundwater inflow monitoring will account for groundwater take from the Sydney Basin Central Groundwater Source in accordance with MCoA C17(j). Results of this accounting will be included in the six-monthly monitoring reports.	Section 5.4
	All data from construction water treatment plants will be reported in the six-monthly water monitoring report.	Section 5.5
	Grab samples will be collected manually from the water treatment plant locations once a month to verify that water from the treatment plants remain below the trigger values for parameters.	Section 5.5

Reference	Requirement	Document Reference
	Water quality results from the water treatment plants will be analysed monthly, along with an overview of corrective actions. The monitoring results will be compared against the requirements for discharge from the EPL and ANZECC (2000) 95% or 99% (for toxicants that bioaccumulate) species protection level. If water quality monitoring from water treatment plants identifies a potential compliance issue, the following actions will be taken: • Higher frequency monitoring will be undertaken to verify the compliance issue is persistent and not a result of a transient event or reporting error. • If compliance issues persist, then – A pollution incident will be reported to NSW EPA – Appropriate management actions will be taken, including but not limited to discharge to sewer under a trade waste agreement, and/or transport of effluent by tanker to an offsite licenced liquid waste disposal facility	Section 5.5 Section 5.6
	Where in-line sensors or monitoring identify treatment plant performance drift outside of the required criteria, the treatment plant may be shut down (if necessary) and/or measures will be implemented to return the plant performance back into the required range. In these instances, water will be discharged to trade waste (where permitted), recycled or disposed offsite at an appropriate licenced liquid waste facility.	Section 3.5

2 DESCRIPTION OF WORKS

The construction activities that took place during the reporting period are outlined in **Table 2.**

Table 2 Construction Activities undertaken during the reporting period

Site	Construction activities
Westmead	Operation of Water Treatment Plant (no offsite discharge) Instrumentation and monitoring works within and adjacent to site Delivery of plant and equipment Off-site spoil haulage General operation of ancillary facilities Station Box excavation and support works Form, reinforcement and concrete pours Mined tunnel excavation and support works
Parramatta	Operation of Water Treatment Plant Instrumentation and monitoring works within and adjacent to site Removal and/or relocating utilities General operation of ancillary facilities Form, reinforcement and concrete pours Internal haul road and station box temporary bridge construction Archaeological excavation and clearance Station box excavation and ground support including strut and waler install Tunnel nozzle construction from station box to the east Delivery of plant and equipment Off-site spoil haulage
Clyde Dive[1]	Bulk earthworks within dive structure General operation of ancillary facilities Mined tunnel excavations Concreting works for dive structure base slabs and deflection wall Form, reinforcement and concrete pours Waterproofing and lining of tunnels Assembly and operation of Lining Erection Machine to line spur tunnels Grout pump station operation Service identification
Clyde MSF[1]	Construction and maintenance of haul roads and site amenities Bulk earthworks Construction of Water conveyance structures Construction of Unwin Street diversion General operation of ancillary facilities Ground improvement works Utility adjustment works Vegetation removal Off-site spoil haulage Creek diversions Contamination remediation
Rosehill[1]	Tunnel Boring Machine excavation Spoil haulage Form, reinforcement and concrete pours Delivery of equipment and segments

Site	Construction activities
	General operation of ancillary facility Water treatment plant operation Grout plant operation
Sydney Olympic Park	Preparation works within station box for tunnel boring machine breakthrough Instrumentation and monitoring works within and adjacent to site Tunnel boring machine breakthrough, retrieval and dismantling works Tunnel nozzle construction and concreting works General operation of ancillary facilities

[1] The Clyde Maintenance and Stabling Facility (MSF) consists of three sub-sites, including the Clyde Dive, the MSF and Rosehill construction sites.

3 MONITORING METHODOLOGY

The following activities were undertaken during the August and October GMEs:

- Preparation of relevant Work Health and Safety Management (WHS) documentation and management of site access
- Mobilisation to site to undertake groundwater level monitoring and groundwater quality sampling at selected accessible groundwater monitoring wells (GWMWs)
- Laboratory analysis of collected samples for Contaminants of Potential Concern (CoPC)
- Assessment of analytical results against groundwater level performance criteria/guideline values (August 2024, October 2024 GMEs)
- Assessment of analytical results against existing groundwater quality performance criteria/guideline values (August 2024, October 2024 GMEs)
- Assessment of analytical results against updated groundwater quality performance criteria/guideline values (August 2024, October 2024 GMEs)
- Preparation of factual groundwater monitoring reports (August 2024, October 2024 GMEs)
- Preparation of a reportable changes risk assessment for groundwater quality reportable changes identified in the October 2024 GME

3.1 Groundwater Monitoring Network

The original proposed groundwater monitoring network consisted of a total of 75 monitoring locations including eight (8) vibrating wire piezometers (VWPs). This network would allow for continued monitoring of shallow and deep groundwater levels during both the construction and post-construction phases of the project and would allow the assessment of any changes in groundwater levels resulting from tunnel and shaft drainage.

During the August and October 2024 GMEs, a number of the proposed GWMWs from the July 2022 baseline monitoring round were either inaccessible and/or destroyed as a result of construction works. Alternative GWMWs, installed as part of the Detailed Site Investigations (undertaken by Epic) were used as replacement GWMWs. These alternative GWMWs were assessed as being appropriate to meet the monitoring program objectives due to their location and geology of the screened interval.

GLC do not undertake in depth groundwater monitoring in the vicinity of the Sydney Olympic Park construction site on account Acciona Ferrovial Joint Venture (AFJV) currently have possession of these wells and report any impacts observed as part of their GWMoP. GLC confirmed this arrangement with the AFJV Completions Manager via email correspondence on 23/10/2024, to prevent unnecessary duplication of findings. This arrangement is also supported by the negligible risk to groundwater imposed by GLC's scope of works at SOP. This is on account TBM activities alone are unlikely to affect groundwater drawdown, unlike Station Box excavation works which have been completed by AFJV at the SOP site (Technical Paper 7 Section 5.12.1).

The groundwater monitoring network accessed during the August and October 2024 GMEs is presented in **Table 3** and shown in **Appendix A – Figures**. None of the network comprises VWPs.

3.1.1 Salinity Monitoring Network

Saline intrusion into the station boxes is monitored through:

- Groundwater sample analysis
- Installation of continuous conductivity, temperature, and depth (CTD) loggers.

Presented in **Table 4** are the locations of where salinity loggers have been installed, these were installed during the January 2023 GME.

Table 4 Saline intrusion Groundwater Monitoring Wells

Site	GWMW ID	Screened depth (mbTOC)	Justification
Parramatta	SMW_BH004_w	20.6 – 23.6	Located north of the station box, to address potential salinity ingress from the Parramatta River
Clyde Dive	SMW_BH057_w	23.3 – 26.3	To address potential salinity ingress from dewatering of the dive structure
Clyde MSF	SMW_BH010_w	23.5 – 26.5	To address potential salinity ingress from dewatering of the box structure
Rosehill	SMW_ENV145_w	11.0 – 14.0	To address potential salinity ingress from dewatering of the box structure

3.2 Gauging and Sampling Methodology

Water levels were gauged using a 30 m electronic interface probe (IP) during inspection and/or groundwater sampling. Selected monitoring bores, as specified in **Table 3**, were equipped with water level loggers (LevelSCOUT, Solinst, InSitu Troll 100, or InSitu Troll 400) to collect continuous groundwater measurements.

The methodology of the groundwater quality and level monitoring are presented in **Table 5**.

Table 5 Groundwater Quality and Level Monitoring Methodology

Action	Description/details
Sample collection objectives	Groundwater quality sampling was undertaken by suitably qualified personnel, in accordance with AS/NZS 5667.11:1998 (Water quality – sampling), with the chosen methodology achieving the following objectives: • Sampling equipment should not change the water quality in any way; particular effort was made to avoid cross contamination between GWMWs and appropriate decontamination methods were adopted where reusable equipment was utilised. • Sufficient water should be removed to ensure the sample is obtained from the aquifer itself rather than from water that is potentially stagnant in the GWMW. • Methods of collection, storage bottles and transportation to the laboratory should suit the type of analysis required.
Gauging and water levels	Water levels were gauged using a 30 m IP. Selected monitoring bores were equipped with water level loggers (Solinst, In Situ Troll 100, or In Situ Troll 400) to collect continuous groundwater measurements. Where GWMWs were sampled, the standing water level (SWL) and total depth (TD) were gauged manually prior to purging, using a cleaned/decontaminated IP.

Action	Description/details
Sampling equipment	Samples were collected using the following equipment: • Peristaltic pump and GWMW specific tubing (HDPE and silicon), or • Hydrasleeve, or • Disposable bailer. The predominant method for sampling was via peristaltic pump. Hydrasleeves and disposable bailers were used for deep GWMWs (where the SWL was beyond the working range of the peristaltic pump).
Purging, field measurements and observations	A low-flow standard operating procedure compliant with AS/NZ 5667.11.1998 was developed for the project to ensure that samples are taken consistently in the same way and at the same depth. Field measurements for physical groundwater parameters were taken using a flow cell and calibrated water quality meter (WQM) fitted with a multi-sensor probe (pH, electrical conductivity (EC), dissolved oxygen (DO), temperature, and oxidation reduction potential (ORP)) during purging. A physical description of the sample, including colour, turbidity (visual), odour, and presence of film, sheen or foam were recorded on standardised field sheets. Field parameters were measured in a flow cell to avoid contact between the groundwater and the atmosphere. Readings of field parameters were recorded at a minimum of every three (3) minutes (where the sampling rate was 100 mL/minute or more) or five minutes (if flow rate was less than 100 mL/minute) until parameters stabilised. Stabilisation is defined as three successive stable parameter readings within the limits defined below: • Dissolved Oxygen (DO) ± 10% of reading or ± 0.2 mg/L • Temperature ± 0.2 °C • pH ± 0.2 pH units • EC ± 3% of reading • ORP ± 20 mV
Sample containers	Groundwater samples were stored in clean laboratory prepared bottles containing the appropriate preservatives.
Sample filtration	Samples for dissolved metal analysis were filtered through a 0.45 µm in-line filter and stored in laboratory prepared bottles containing nitric acid preservative.
Sampling records	Field sampling records were recorded on Survey123 (digital) using unique sampling identification nomenclature consisting of the sample identification, sample date, location, and sampler details. Daily field sheets are presented in **Appendix D – Field Data Sheets** Details of all water quality samples were recorded on the field sheets and laboratory chain of custody (COC) documents.
Decontamination	Equipment was cleaned periodically and between sampling locations to prevent a build-up of sediment and prevent cross-contamination. The following methodology was followed: • Rinse the equipment in tap water • Clean with a 1:100 ratio of Liquinox (PFAS free decontamination detergent concentrate) to deionised water • Rinse with tap water • Thorough rinse with laboratory supplied deionised water • Allow to dry away from dust and direct sunlight
Sample Labelling, Storage and Transport	All samples were clearly labelled with unique identification numbers consisting of the date, sample location and samplers' initials. All samples were bagged and kept in an ice filled Esky prior to dispatch and during transport to a NATA registered laboratory, under chain-of-custody procedures.

3.3 Laboratory Analysis

Groundwater samples were sent to NATA accredited laboratories for analysis of selected CoPC as listed below:

- General water quality parameters – EC, Total dissolved solids (TDS), Alkalinity, Hardness
- Major Ions – Calcium, Magnesium, Potassium, Bicarbonate, Sodium, Chloride, Sulfate
- Extended Heavy Metals Suite – Arsenic (As), Cadmium (Cd), Chromium III (Cr(III)), Chromium VI (Cr(VI)), Copper (Cu), Mercury (Hg), Lead (Pb), Nickel (Ni), Zinc (Zn), Manganese (Mn), Iron (Fe)
- Nutrients – Total Nitrogen, Total Oxidised Nitrogen, Nitrate, Nitrite, Ammonia, Total Phosphorous, Total Reactive Phosphorous, Total Kjeldahl Nitrogen
- Total petroleum hydrocarbons (TPH) – C6-C9, C10-C14, C15-C28, C29-C36, C10-C36 (Sum of total)
- Total recoverable hydrocarbons (TRH) – C6-C10, C6-C10 (F1 minus BTEX), C10-C16, C10-C16 (F2 minus Naphthalene), C16-C34, C34-C40, C10-C40 (Sum of total)
- Aromatic Hydrocarbons (BTEXN) – Benzene, Toluene, Ethylbenzene, Xylene, Naphthalene
- Polycyclic Aromatic Hydrocarbons (PAHs)
- Volatile Organic Compounds (VOCs)
- Per- and Poly-Fluoroalkyl Substances (PFAS) - Perfluorobutane sulfonic acid (PFBS), Perfluorohexane sulfonic acid (PFHxS), Perfluorooctanesulfonic acid (PFOS), Perfluorooctanoic acid (PFOA) Quality Assurance/Quality Control Plan

The following quality assurance (QA) and quality control (QC) protocols were proposed for the monitoring program in accordance with protocols outlined in the Project Construction Groundwater Monitoring Program (GLC, 2024) which references the following guidelines/standards.

- Australian/New Zealand Standards (1998). Water Quality – Sampling Part 1: Guidance on the Design of Sampling Programs, Sampling Techniques and the Preservation and Handling of Samples. AS/NZS 5667.1:1998, Reconfirmed 2016. Standards Australia, NSW.
- Australian/New Zealand Standards (1998). Water Quality – Sampling Part 11: Guidance on Sampling of Groundwater. AS/NZS 5667.11.1998, Reconfirmed 2016. Standards Australia, NSW.
- HEPA (2020) PFAS National Environmental Management Plan Version 2.0

Details of QA/QC procedures are presented in **Table 6**.

Table 6 QA/QC procedures

Action	Description/details
Rinsate samples	Rinsate blanks were collected from the IP during each day of sampling Rinsate blank samples were collected at a rate of one per day of sampling or where uncertainty regarding the potential for contamination was noted.
Duplicate samples	Intra- and inter-laboratory duplicate samples were analysed at a rate of greater than one per ten primary samples (10%), respectively. The results on the duplicate sampling (RPDs) are presented in **Appendix B – Tables**
Trip blank and trip spikes	A sample of laboratory supplied deionised water accompanied the primary samples over the course of the fieldworks and was submitted to the laboratory for analysis. A laboratory prepared trip blank and trip spike sample was included at a rate of one per laboratory batch.

Action	Description/details
Equipment calibration	Equipment used during monitoring was calibrated prior to use. Calibration records are presented in **Appendix F – Calibration Certificates**
Laboratory QA/QC	Laboratory analysis was conducted in accordance with the standard test methods outlined in Schedule B(3) of the NEPM (NEPC, 2013), US EPA, APHA or equivalent modified methods supported by adequate quality control. Laboratory analysis was undertaken by NATA accredited laboratories, Envirolab Services and ALS Laboratory Group. As part of Epic's internal quality control, all the information collected from the laboratory was checked. The results of both laboratories have been assessed and validated progressively using recognised QA procedures and the analytical data is considered of sufficient quality to allow environmental interpretive use. Data validation sheets for each laboratory batch are presented in **Appendix E – Laboratory Documentation**

3.4 Water Treatment Plants

During the reporting period (20 July 2024 to 19 January 2025), the Rosehill Permanent Water Treatment Plant, Parramatta Construction Water Treatment Plant and Westmead Permanent Water Treatment Plants were operational across the project.

3.4.1 Operations during the reporting period

3.4.1.1 Rosehill temporary Water Treatment Plant

The Rosehill temporary water treatment plant, identified as Point 2 under EPL 21676, was decommissioned in July 2023 and later removed from the EPL. There was no water discharged from this plant during the reporting period.

3.4.1.2 Westmead Permanent Water Treatment Plant

The Westmead permanent water treatment plant, identified as Point 3, was commissioned on 10th January 2024. It was operating to discharge until 19th January 2024. Following this, the demand to reuse treated water onsite matched that of the supply from the water treatment plant and there has been no discharge to the environment since.

Inflow to the Westmead Permanent Water Treatment Plant comprised of minimal groundwater, stormwater runoff and reused industrial process water from tunnelling activities, dust suppression and plant/vehicle washdown on-site. No sampling events occurred during the reporting period.

3.4.1.3 Rosehill Water Treatment Plant

The Rosehill Permanent Water Treatment Plant is identified as Point 4 under EPL 21676. Commissioning of the Rosehill Water Treatment Plant occurred on 8th August 2023, only post-commissioning sampling results are reported in this document. Eleven (11) sampling events occurred during the reporting period.

Inflow to the Rosehill Permanent Water Treatment Plant comprised of groundwater, stormwater runoff collecting in excavation areas, and washdown water.

3.4.1.4 Parramatta Construction Water Treatment Plant

The Parramatta construction water treatment plant, identified as Point 5, was commissioned on 8th March 2024. 8 sampling events have occurred during the reporting period.

Inflow to the Parramatta Construction Water Treatment Plant comprised of minimal groundwater, stormwater runoff and reused industrial process water from excavation activities, dust suppression and plant/vehicle washdown on-site.

Over the reporting period, there have been two periods where the demand to reuse treated water on-site has matched that of supply from the water treatment plant which resulted in a suspension of water being discharged from the Parramatta Metro construction site to the environment. When on-site demand was reduced, water quality monitoring was undertaken, and continuous discharge recommenced in accordance with the requirements of EPL 21676.

3.4.2 Water sampling methodology

The following was undertaken as part of the Water Treatment Plant post-commissioning sampling:

- Conduct pre- and post-treatment water sampling.
- Laboratory analysis of collected samples.
- Assessment of analytical results against performance criteria/guideline values.
- Preparation of Water Treatment Plant performance reports in accordance with condition E2.1 of the EPL 21676.

A pre- and post-treatment grab sample was collected for each sampling event, at least once a month. The pre-treatment sample was collected from the pre-treatment storage tank, and the post-treatment sample was collected from an in-line valve located between the final filter pod and discharge tank. Dedicated sampling containers were provided by a NATA accredited laboratory and were filled by a trained GLC Environmental personnel in accordance with laboratory specified requirements. Samples were delivered to the laboratory under chain of custody protocols and submitted for analysis for the list of analytes stipulated in condition L2, for the respective discharge points in the EPL 21676. Where an analyte is observed to be inconsistent with the relevant discharge criteria, the process and measures detailed in Section 9.1.2 of the GWMoP would be implemented.

4 PERFORMANCE CRITERIA

4.1 Groundwater Level Monitoring

Seasonal fluctuations in groundwater level that were observed in the EIS and supplementary reports, have been used as a basis to determine whether changes in groundwater levels (specifically drawdown) can be attributed to dewatering activities associated with construction of the project.

In accordance with the Aquifer Interference Policy (AIP) minimal impact considerations, groundwater level and pore pressures will be assessed against the following criteria where appropriate (DPI-Water, 2012):

Less than or equal to 10 % cumulative variation in the water table, allowing for typical climatic "post-water sharing plan" variations, 40 m from any:

- *high priority groundwater dependent ecosystem*
- *high priority culturally significant site listed in the schedule of the relevant water sharing plan*
- *A cumulative maximum of 2 m decline in water level or pore pressure at any water supply bore*

The nearest high priority groundwater dependent ecosystems (GDEs) and water supply bores are summarised in **Table 7.** These were identified in Jacobs (2020) Technical Paper 7 (Hydrogeology).

Table 7 Groundwater Sensitive Receptors

Site	High priority GDE	Nearest water supply bore
Westmead	Grey Box - Cumberland Plain Woodland 220m E	GW108378 780 m NNW
Parramatta	Grey Box - Cumberland Plain Woodland 590m WNW	GW108661 565 m NNW
Clyde Dive	Salt Marsh Estuaries of the Sydney Basin Bioregion 1.4 km SE	GW107659 1.9 km WNW
Clyde – Rosehill	Salt Marsh Estuaries of the Sydney Basin Bioregion 800m SE	GW107659 1.8 km NW
Sydney Olympic Park	Salt Marsh Estuaries of the Sydney Basin Bioregion 1.3 km NNE	GW305646 3.3 km WSW

As there are no high priority GDEs/culturally significant sites/water supply bore within 40 m of the project site, comparisons of groundwater drawdown will solely be made to the predicted drawdown from the groundwater modelling. (GLC, 2022b; GLC 2022c). A summary of predicted drawdown values across the modelled zones is presented in **Table 8**. Modelling of drawdown was not completed for SOP, therefore there is no groundwater level assessment criteria for SOP.

Table 8 Predicted drawdown across the project

Site/Area	Scenario	Drawdown threshold (m)	Reference
Clyde	Likely case (at approximate time of handover – 2.6 years)	0.5 – 3.0	GLC, 2022b
Rosehill	Long term (operational phase)	≤ 1.0	GLC, 2022c
Parramatta	Likely flow case (no treatment) (at handover – 2 years)	0.5 – 4.0	GLC, 2022b
Westmead	Likely flow case (at handover – 2 years after commencement of construction)	0.5 – 20.0	GLC, 2022b

4.2 Groundwater Quality Monitoring

Performance Criteria for groundwater quality is detailed in the Rev D GMP. Area and aquifer-based performance-based trigger values were derived for the following areas:

- Clyde MSF
  - Clyde Zone 1 – shallow aquifer
  - Clyde Zone 5a – shallow aquifer
  - Clyde Zone 4w + 5b + 6 - shallow aquifer
  - Clyde Zone 4w + 5b + 6 - deep aquifer
- Rosehill
  - Rosehill + Clyde zone 2 – shallow aquifer
  - Rosehill + Clyde zone 2 – deep aquifer
- Clyde Dive
  - Clyde Zone 3 – shallow aquifer
  - Clyde Zone 3 – deep aquifer
- Parramatta
  - Parramatta – shallow aquifer
  - Parramatta – deep aquifer
- Westmead
  - Westmead – shallow aquifer
  - Westmead - deep aquifer

These areas are shown in **Appendix A – Figures**

. The August 2024 and October 2024 GME results have been compared to the performance criteria based on the Rev D GMP (detailed below).

4.2.1 Groundwater Quality Monitoring

Trigger values comprising NEPM GILs, PFAS NEMP 2.0, and ANZECC (2000) / ANZG (2018) 95% species protection criteria and calculated baseline trigger values have been adopted as the indicator values of the performance criteria for groundwater quality. Any changes in groundwater quality will be measured relative to these performance criteria. Results from sampling events and continuous loggers fitted with salinity sensors will be used to assess against performance criteria for potential saline intrusion, as well as reviewing field total dissolved solids (TDS) concentrations.

A reportable change in groundwater quality is be defined as:

- A parameter exceeding either the NEPM GIL, ANZECC (2000), or ANZG (2018) value over a sustained period (i.e., for at least 3 consecutive monitoring rounds), which has been recorded during baseline monitoring as non-detect or below the NEPM GIL, ANZECC (2000), or ANZG (2018) value, or
- A parameter increasing in concentration over a sustained period (i.e., for at least 3 consecutive monitoring rounds) to more than 2x the baseline trigger value, where the baseline trigger value exceeds the NEPM GIL trigger value, or
- A parameter increasing in concentration over a sustained period (i.e., for at least 3 monitoring rounds) to more than 2x the baseline trigger value, where the baseline trigger value exceeds the ANZECC (2000) or ANZG (2018) trigger value.

Once a reportable change for groundwater quality and salinity has been identified, statistical analysis (via Mann Kendall trend analysis or other means) will determine whether it is a significant change in groundwater quality. Where a significant trend in groundwater quality is identified (based on the Mann Kendall results), this will trigger desktop investigation. The objectives of the desktop investigation are to determine if:

- The contaminant concentrations are likely to present a potential immediate risk to human health or the environment which have previously not been identified (e.g. concentration significantly exceeds site concentration maximums), or
- The contaminants have potentially been introduced to groundwater directly as a result of construction activities (e.g. TRH introduced from site leaks and spills), or
- Contaminant migration is potentially occurring resulting in degradation of groundwater quality within and around sensitive receptors (including GDEs and groundwater supply bores)

Additional monitoring and management responses are to be undertaken in circumstances where any of the above-mentioned scenarios are demonstrated as likely. Monitoring frequency is to increase to monthly to further assess the potential requirements for management responses.

Desktop investigation may include but not be limited to:

- Assessment of potential sources of contamination
- Comparison to existing site data
- Investigation of recent site activities (e.g. unexpected finds, incidents)
- Assessment of contaminant migration pathways

This process is shown schematically in **Figure 2**.

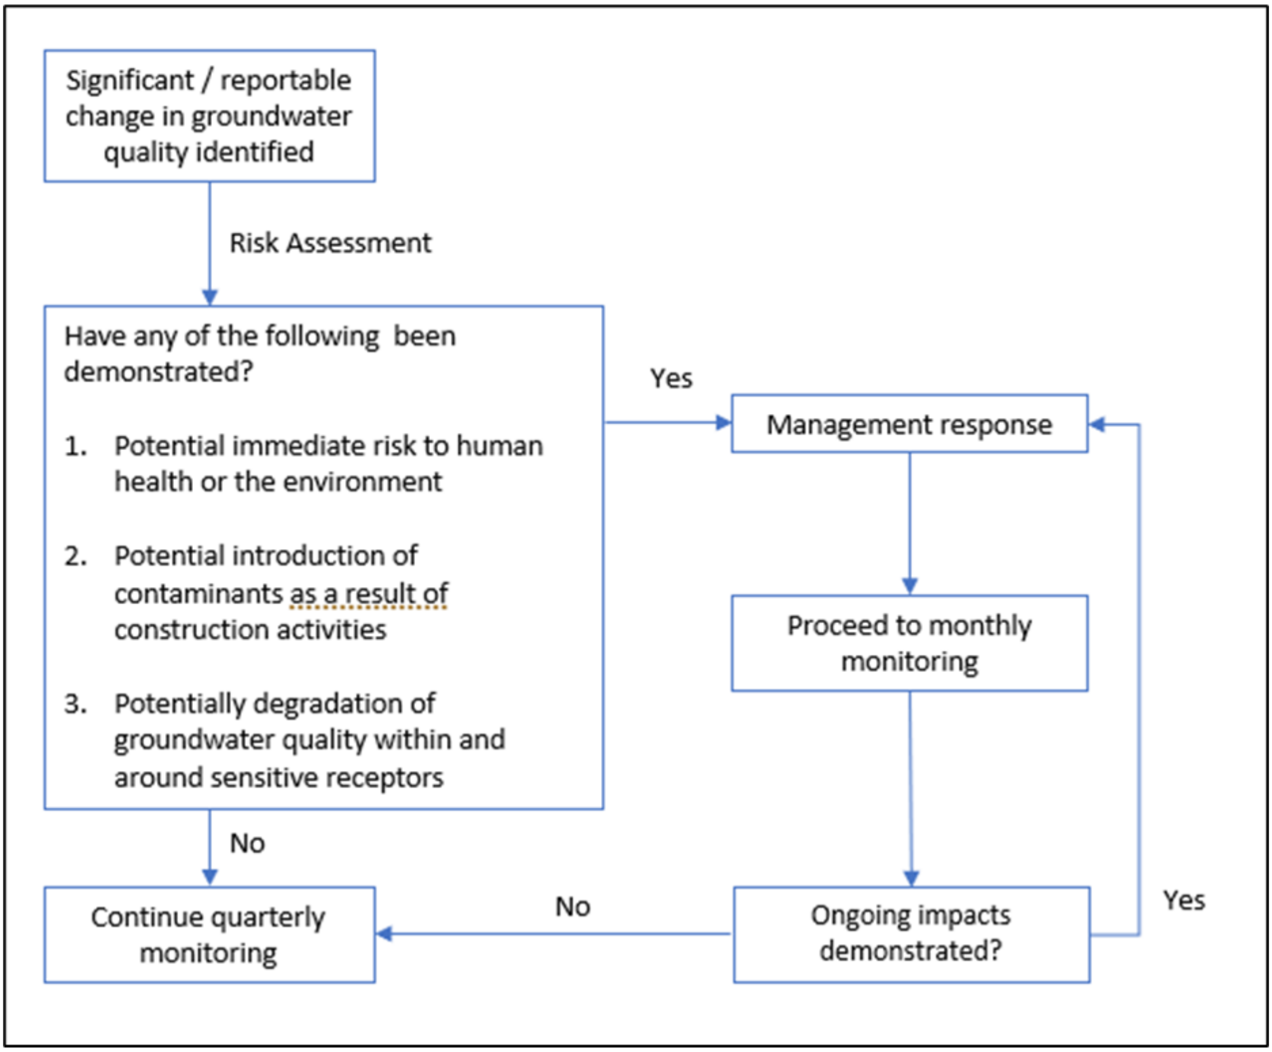

Figure 2: Trigger value exceedance flowchart

4.2.1.1 Salinity

Salinity will be assessed using TDS readings, and in monitoring wells where continuous salinity loggers are placed. A reportable change in salinity will be defined as:

- An increase of salinity over a sustained period (i.e., for at least 3, consecutive monitoring rounds) to more than 2x the baseline trigger value

Once a reportable change for salinity has been identified, statistical analysis (via Mann Kendall trend analysis or other means) will determine whether it is a significant change in groundwater quality.

Where a significant trend in groundwater salinity is identified, this will trigger further desktop investigation. The objective of the desktop investigation will be to determine if increases in salinity have the potential to impact groundwater extractive users and aquifer beneficial uses. The review will assess the historical and surrounding monitoring bore data, and modelling predictions.

Additional monitoring and management responses are to be undertaken in circumstances where the desktop review demonstrates that the above-mentioned scenario is likely. Monitoring frequency is to increase to monthly to further assess the potential requirements for management responses.

This process is shown schematically in **Figure 2**.

4.2.1.2 Acid Sulfate Soils

To assess for the activation of ASS, a Schoeller diagram will be generated. A Schoeller diagram will plot major anion, cation and pH values to identify deviations in the concentrations of base anion/cations from baseline conditions to construction works. Total alkalinity, measured in groundwater, decreasing below 30 mg/l as CaCO3 is considered to represent a reduction in the acid buffering capacity of the soil.

If the pH reduces by one unit as compared to the baseline pH range prior to excavation, this indicates that ASS may have been activated.

4.3 Rosehill Water Treatment Plant

The EPL (21676) condition L2, Point 4, stipulates the concentration limits i.e., discharge criteria for the Rosehill Permanent Water Treatment Plant to Duck River. The concentration limits can be found in **Table 9**.
A variation (Notice #1645354) was approved on 19th December 2024 to increase the Chromium (VI) and Total Nitrogen concentration limits, which are represented in **Table 9** below.

Table 9 Rosehill Permanent Water Treatment Plant, Point 4 Discharge Criteria

Parameter	Units	50th Percentile	90th Percentile	100th Percentile
Ammonia	µg/l			910
Chromium (VI)	µg/l	15		30
Cobalt	µg/l			5
Copper	µg/l			1.3
Nitrogen (total)	µg/l		1200	1800
Nitrate + nitrite (oxidised nitrogen)	µg/l			1200
Perfluoroctane Sulphonate (PFOS)	µg/l			0.13
Phosphorus (total)	µg/l			90
Zinc	µg/l			12

4.4 Westmead Water Treatment Plant

In the Project EPL (21676) condition L2, Point 3, stipulates the concentration limits i.e., discharge criteria for the Westmead Permanent Water Treatment Plant to Domain Creek. The concentration limits can be found in **Table 10**.

Table 10 Point 3 of EPL 21676 Discharge Criteria

Parameter	Units	Criteria
Ammonia	µg/l	200

Arsenic (total)	µg/l	13[1]
Cadmium	µg/l	0.2
Chromium (VI)	µg/l	1.0
Chromium (III)	µg/l	27
Cobalt	µg/l	1.4
Copper	µg/l	1.4
Electrical conductivity	µS/cm	2,200[3]
Iron	µg/l	300[2]
Lead	µg/l	3.4
Manganese	µg/l	1,900
Mercury	µg/l	0.06
Nickel	µg/l	11
Nitrate + nitrite (oxidised nitrogen)	µg/l	200
Nitrogen (total)	µg/l	1,000
Perfluorooctane sulphonate (PFOS)	µg/l	0.13
pH	pH	6.5 – 8.5
Phosphorus (total)	µg/l	25
TPH C10-C36 Fraction	µg/l	100
TPH C6-C9 Fraction	µg/l	100
Turbidity	NTU	20
Zinc	µg/l	8

1. Criteria adopted from ANZG (2018) for fresh water under 95% species protection level, and 99% species protection for bioaccumulating toxicants
2. Guidelines for Canadian Drinking Water Quality: Guideline Technical Document – Iron
3. EPL criteria specified in µS/cm using sampling method of in-field by probe. Conversion has been applied in reported results as Horiba Water Quality Meter samples as mS/cm

4.5 Parramatta Water Treatment Plant

In the Project EPL (21676) condition L2, Point 5, stipulates the discharge criteria for the Parramatta Construction Water Treatment Plant to Parramatta River downstream of the Charles Street Weir. The concentration limits can be found in **Table 11**.

Table 11 Point 5 of EPL 21676 Discharge Criteria

Point	Parameter	Units	Criteria
5	Ammonia	µg/l	790
5	Arsenic	µg/l	13
5	Cadmium	µg/l	0.7
5	Chromium (VI)	µg/l	4.4
5	Chromium (III)	µg/l	4.4
5	Cobalt	µg/l	1
5	Copper	µg/l	1.3
5	Iron	µg/l	300

5	Lead	µg/l	1

5 RESULTS

5.1 Registered Groundwater Bores

A review of the registered groundwater bores in the 3 km buffer of the Project alignment was undertaken during the July 2022 baseline factual monitoring report, which detailed the existing registered groundwater bores.

5.2 GWMW Condition Assessment

The condition assessment of the GWMWs across the entire groundwater monitoring network (refer to **Table 3**) was carried out during the August 2024 and October 2024 GMEs. The assessment was unable to locate several GWMWs as detailed in **Table 12**. GWMWs listed below were not sampled, and were presumed to be destroyed, were inaccessible due to construction activities on site, or were inaccessible due to other access constraints. GWMWs that were assessed as being suitable for sampling and/or gauging are detailed in **Table 3.**

Replacement GWMWs have been identified throughout each groundwater monitoring event, to ensure that the monitoring program collects the necessary groundwater monitoring data required to gain a robust characterisation of the works.

Table 12 GWMW Condition Assessment

GWMW ID	Details
August 2024 monitoring event	
CZ1_MW500_w	Likely destroyed - unable to access due to construction activities
CZ1_MW501_w	Unable to access due to construction activities
CZ1_MW502_w	Likely destroyed - unable to access due to construction activities
SMW_ENV149_w	Likely destroyed - unable to access due to construction activities
SMW_ENV148_w	Unable to access due to construction activities
SMW_ENV231	Covered by fill/unable to locate due to changes on site
SMW_ENV232A	Decommissioned (concrete-filled) – unable to use
SMW_ENV229_w	Covered by fill/unable to locate due to changes on site
SMW_ENV227_w	Likely destroyed - unable to access due to construction activities
GALC-MW12	Destroyed – unable to access due to construction activities
CZ5_MW16	Destroyed – unable to access due to construction activities
SMW_ENV226_w	Decommissioned – unable to use
SMW_ENV146	Inspected and in unusable condition (on road)
GALC-MW32A	Unable to locate due to changes on site
PM_BH57	Likely destroyed - unable to locate due to archaeological digging onsite
PM_BH21	Likely destroyed - unable to locate due to archaeological digging onsite
CZ1_BH71	Unable to locate due to site car park
SMW_WTP_BH41	Likely destroyed – located in an area comprising a new piling pad

GWMW ID	Details
SMW_ENV250	Destroyed – unable to use
SMW_ENV044	Marked by surveyor to be on haul road, unable to locate
October 2024 monitoring event	
CZ1_MW500_w	Likely destroyed - unable to access due to construction activities
CZ1_MW501_w	Likely destroyed - unable to access due to construction activities
CZ1_MW502_w	Likely destroyed - unable to access due to construction activities
SMW_ENV149_w	Likely destroyed - unable to access due to construction activities
SMW_ENV148_w	Likely destroyed - unable to access due to construction activities
SMW_ENV231	Covered by fill/unable to locate due to changes on site
SMW_ENV232A	Decommissioned (concrete-filled) – unable to use
SMW_ENV229_w	Covered by fill/unable to locate due to changes on site
SMW_ENV227_w	Likely destroyed - unable to access due to construction activities
GALC-MW12	Destroyed – unable to access due to construction activities
CZ5_MW16	Destroyed – unable to access due to construction activities
SMW_ENV226_w	Decommissioned – unable to use
SMW_ENV146	Inspected and in unusable condition (on road)
GALC-MW32A	Unable to locate due to changes on site
PM_BH57	Likely destroyed - unable to locate due to archaeological digging onsite
PM_BH21	Likely destroyed - unable to locate due to archaeological digging onsite
CZ1_BH71	Unable to locate due to site car park
SMW_WTP_BH41	Likely destroyed – located in an area comprising a new piling pad
SMW_ENV250	Destroyed – unable to use
SMW_ENV044	Marked by surveyor to be on haul road, unable to locate
GALC-MW18	Decommissioned by GLC – unable to use
CZ5a_MW102	Damaged at the time – unable to use
CZ1_D35_MW01	Inaccessible – in an asbestos exclusion zone at the time

5.3 Groundwater Levels

5.3.1 Manual Groundwater Level Monitoring

Water levels were manually measured at GWMWs during the August 2024 and October 2024 GMEs. The results are presented in **Table 13**. GWMWs that were for contamination purposes were not surveyed, however the additional groundwater level information adds a more robust conceptualisation of groundwater levels within the scheme. These works were undertaken by suitably qualified field staff and reviewed by a suitably qualified hydrogeologist.

5.3.2 Automatic Groundwater Level Trends/Performance Criteria Assessment

Selected GWMWs have been equipped with water level probes. These GWMWs have provided continuous groundwater level measurements and have been accessed quarterly by Epic. Hydrographs were produced by a suitably qualified hydrogeologist. Hydrographs showing the continuous groundwater level monitoring for the GWMWs are presented in **Appendix C –** Hydrographs. Salinity trends for the GWMWs, detailed in **Table 4** are presented in **Appendix C –** Hydrographs.

Measured water levels at selected monitoring locations are presented in **Table 14**.

Table 14 Groundwater Drawdown at Select Locations

[1] This well is part of the geotechnical monitoring located across the project, operated by GLC. It is being used as a replacement well for SMW_ADD_BH02_w
[2] Groundwater modelling did not calculate drawdown located at these monitoring bores, therefore pre-construction SWLs are not considered relevant
[3] drawdown threshold as determined from groundwater modelling reports (GLC, 2022b; GLC, 2022c), values in **bold** indicate a reportable change (**Section 5.3.3**)
[4] This is a replacement well for SMW_ENV042 as detailed in the previous six-monthly report

Salinity and conductivity trends are consistent across the monitoring period.

5.3.3 Performance Criteria Assessment

Performance criteria assessment was undertaken by a suitably qualified hydrogeologist.

Compared to the AIP criteria, there are no reportable changes in groundwater level. These exceedances are not reportable to the AIP criteria due to GWMWs used for assessing drawdown being greater than 40 m away from the following:

- high priority groundwater dependent ecosystem
- high priority culturally significant site listed in the schedule of the relevant water sharing plan
- a cumulative maximum of 2 m decline in water level or pore pressure at any water supply bore.

Drawdown was assessed for each borehole with automatic loggers installed. Comparison with the groundwater modelling drawdown predictions (after two (2) years - high case model) identified reportable changes, detailed in **Table 15**.

Table 15 Reportable change in groundwater level

Monitoring zone	GWMW ID	Aquifer (modelling report)	Typical pre-construction GWL (mAHD)	Construction GWL – October 2024 (mAHD)	Drawdown (m)	Drawdown threshold (m), as per modelling report
Clyde MSF	SMW_WTP_BH25_w	Not reported	3	-1.5	4.5	<1
Rosehill	SMW_BH010_w	Not reported	3	-6.1	9.1	<1
Rosehill	SMW_ENV145_w	Not reported	3.5	-5.2	8.7	<1
Clyde Dive	SMW_BH057_w	Ashfield shale	2	-9.8	11.8	2.5
Clyde Dive	GALC_MW16_w	Ashfield shale	2	-3.6	5.3	2.5

Recommended actions from reportable changes in groundwater level are detailed in **Table 16**. As the reportable changes are solely due to differences identified based on groundwater modelling, and not based on AIP criteria, no management actions have been deemed necessary.

For SMW_ENV042_w, it was recommended to drill a replacement well. However, due to access arrangements and site shutdown works, this was not possible. CZ4e_MW02 (response zone 2.6 – 6.0 mbTOC) has been used as a replacement GWMW. As detailed in **Table 15**, the drawdown encountered at this GWMW did not meet the drawdown threshold.

Table 16 Recommended actions from the reportable changes in groundwater level

Location	GWMW	Recommended action
Rosehill	SMW_WTP_BH25_w	• Observed drawdown does not indicate potential for unacceptable impacts to the environment or human health • No management action required • Confirm GLC’s groundwater modelling consultant that <1 m drawdown is correct for adoption as trigger value for this GWMW • Continue monitoring as part of the quarterly groundwater monitoring program
	SMW_ENV145_w	• Observed drawdown does not indicate potential for unacceptable impacts to the environment or human health • No management action required • Confirm with GLC’s groundwater modelling consultant that <1 m drawdown is correct for adoption as trigger value for this GWMW • Continue monitoring as part of the quarterly groundwater monitoring program
	SMW_BH010_w	• Observed drawdown does not indicate potential for unacceptable impacts to the environment or human health • No management action required • Confirm with GLC’s groundwater modelling consultant <1 m drawdown is correct for adoption as trigger value for this GWMW • Continue monitoring as part of the quarterly groundwater monitoring program
Clyde Dive	SMW_BH057_w	• Observed drawdown does not indicate potential for unacceptable impacts to the environment or human health

Location	GWMW	Recommended action
		• No management action required • Confirm with GLC's groundwater modelling consultant that modelled drawdown is correct for adoption as trigger value for this GWMW • Continue monitoring as part of the quarterly groundwater monitoring program
	GALC-MW16 (replacement for SMW_ADD_BH02_w)	• Observed drawdown does not indicate potential for unacceptable impacts to the environment or human health • No management action required • Confirm with GLC's groundwater modelling consultant that modelled drawdown is correct for adoption as trigger value for this GWMW • Continue monitoring as part of the geotechnical monitoring program

5.4 Groundwater Inflow Assessment

5.4.1 Methodology

Estimations of groundwater inflow into the excavations (Rosehill, Clyde Dive, Parramatta station box, Westmead station box) has been completed to assess groundwater take from the Syndey Basin Central Groundwater Source. Determining groundwater inflow through corresponding the influent rates to the respective WTPs is not appropriate due to the influent rate being a combination of rainfall runoff, addition of water for grout mixture, recycling of water from TBM operations, and groundwater inflow.

Therefore, the observed changes in groundwater level have been used to estimate the amount of groundwater inflow entering each excavation. The time variant Cooper-Jacob equation (Kruseman & de Ridder, 1994), based on the Theis equation, has been used. This equation relates the monitored change in groundwater level (drawdown) to groundwater inflow. For Rosehill, Clyde Dive, and Westmead, the Cooper-Jacob equation for unconfined aquifers has been used. For Parramatta, the Cooper-Jacob equation for confined aquifers has been used. This is due to the pre-construction groundwater level data at Parramatta indicating that groundwater levels within the shallow alluvial aquifer are hydraulically distinct from the groundwater levels in the bedrock aquifer (Ashfield Shale, Hawkesbury Sandstone). The bedrock aquifer has been modelled as the excavation (nozzles/tunnels/station box) is principally within the bedrock aquifer.

The Cooper-Jacob equation for unconfined aquifers is as follows:

$$Q = \frac{4 \times \pi \times T \times s_c}{2.3 \times \log\left(\frac{2.25 \times T \times t}{r^2 \times S}\right)}$$

Where:

Q	[m³/d]	is the estimated inflow rate into the excavation
T	[m²/d]	is the transmissivity of the unconfined aquifer
s_c	[m]	is the corrected drawdown observed at the monitoring well
t	[d]	is the days since the start of groundwater interaction
S	[-]	is the storage coefficient of the aquifer

r [m] is the radial distance of the monitoring well from the excavation

Transmissivity is the product of the thickness of the aquifer (determined from the base of excavation to the water level at time t) and the hydraulic conductivity of the aquifer. A weighted arithmetic mean was used to provide a representative hydraulic conductivity value.

Storage coefficient of the aquifer is determined as:

$$S = S_y + (S_s \times Thickness\ of\ aquifer)$$

Where:

S_y [-] is the specific yield of the aquifer

S_s [1/m] is the specific storativity of the aquifer

The corrected drawdown is calculated as follows:

$$s_c = \left(1 - \frac{s_a}{2 \times thickness\ of\ aquifer}\right)$$

Where

s_a [m] is the observed drawdown

The following condition is required to be met for the Cooper-Jacob equation to be valid.

$$u = \frac{r^2 \times S}{4 \times T \times t} < 0.01$$

The Cooper-Jacob equation for unconfined aquifers is as follows:

$$Q = \frac{4 \times \pi \times T \times s_a}{2.3 \times \log\left(\frac{2.25 \times T \times t}{r^2 \times S}\right)}$$

With the following adjustments:

- Transmissivity is defined as the thickness of the aquifer (base of excavation to the top of the bedrock aquifer)
- Storage coefficient of the aquifer is the product of the specific storability and the thickness of the bedrock aquifer

The following assumptions apply to these equations:

- The aquifer has infinite areal extent
- The aquifer is homogeneous and isotropic
- The water removed from storage is discharged instantaneously with decline of groundwater level
- The water collected in the excavation is collected and sent to the WTP immediately, i.e. the storage in the excavation can be ignored
- The time since the start of groundwater interaction has been determined from the groundwater quality trigger values report (GLC, 2024), as this is the time from when significant interaction with groundwater started for each area

From the monitoring data, a monthly drawdown has been calculated, enabling for a monthly inflow estimation to each excavation. For each excavation, multiple groundwater monitoring wells have been used in the estimations, to allow for a more refined inflow estimate.

5.4.2 Rosehill

The ground model and hydrogeological parameters for Rosehill is detailed in **Table 17**. The following groundwater monitoring wells were used/not used in the inflow estimation:

- SMW_WTP_BH25_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well
- SMW_BH010_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well
- CZ4e_MW02_w: No – drawdown is not observed at this groundwater monitoring well. This is likely due to being screened within the shallow aquifer
- SMW_ENV145 _w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well

Table 17 Ground model and hydrogeological parameters used for Rosehill

Unit	From[a] (m)	To[a] (m)	Thickness[a] (m)	Hydraulic conductivity[a] (m/d)	Specific Storativity[a] (1/m)	Specific Yield[a] (-)
Alluvium	5.0	-10.0	15.0	0.1	-	-
Ashfield Shale	-10.0	-22.0[a,b]	12.0	0.02	5.00×10^{-6}	0.0005
Representative hydraulic conductivity				0.03		

a = parameters taken from the HIR GLC (2022b)
b = base of aquifer defined as the base of excavation, defined in the HIR GLC (2022c)

Appendix J – groundwater inflow estimates shows the corresponding groundwater inflow for each well used in the estimate, with **Table 18** summarising the estimate inflows of the monitoring period.

Table 18 Groundwater inflow estimates into Rosehill over the reporting period

Groundwater monitoring well	Distance to excavation (m)	Average groundwater inflow estimate (Jun 24 to Oct 24) (m^3/d)	Average groundwater inflow estimate (m^3/d)	Maximum allowable groundwater seepage (m^3/d)[a]	Total groundwater inflow estimate over 6 months (m^3)
SMW_WTP_BH25_w	113	10.4	17.1	45.0	3,184.7
SMW_BH010_w	160	20.4			
SMWENV145_w	160	20.6			

a = Project construction groundwater monitoring program (GLC, 2024)

5.4.3 Clyde Dive

The ground model and hydrogeological parameters for Clyde Dive is detailed in **Table 19**. The following groundwater monitoring wells were used/not used in the inflow estimation:

- SMW_ENV039_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well
- GALC_MW16_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well
- SMW_BH057_w: No – groundwater drawdown is observed at this groundwater monitoring well; however calculations show that the Cooper-Jacob equation is not valid for this groundwater monitoring well
- SMW_BH057_s: No – groundwater drawdown is not observed at the groundwater monitoring well. This is likely due to being screened within the shallow aquifer
- SMW_ENV009_w: No – groundwater drawdown is not observed at the groundwater monitoring well. This is likely due to being screened within the shallow aquifer

Table 19 Ground model and hydrogeological parameters used for Clyde Dive

Unit	From[a] (m)	To[a] (m)	Thickness[a] (m)	Hydraulic conductivity[a] (m/d)	Specific Storativity[a] (1/m)	Specific Yield[a] (-)
Residual	14	8	6	0.1	-	-
Ashfield Shale	8	-6	14	0.01	5.00×10^{-6}	0.005
Mittagong Formation	-6	-10	4	0.034	-	-
Hawkesbury Sandstone	-10	-12[b]	2	0.034	-	-
Representative hydraulic conductivity				0.04		

a = parameters taken from the HIR GLC (2022b)
b = base of aquifer defined as the base of excavation, defined in the HIR GLC (2022b)

Appendix J – groundwater inflow estimates shows the corresponding groundwater inflow for each well used in the estimate, with **Table 20** summarising the estimate inflows of the monitoring period.

Table 20 Groundwater inflow estimates into Clyde Dive over the reporting period

Groundwater monitoring well	Distance to excavation (m)	Average groundwater inflow estimate (Jun 24 to Oct 24) (m^3/d)	Average groundwater inflow estimate (m^3/d)	Maximum allowable groundwater seepage (m^3/d)	Total groundwater inflow estimate over 6 months (m^3)
SMW_ENV039_w	30.0	1.1	1.3	1.7	244.8
GALC_MW16_w		1.0	1.6		

a = Project construction groundwater monitoring program (GLC, 2024). Determined from **operational** criteria of 5.0 $mL/m^2/hr$, equivalent to 0.00012 $m^3/m^2/d$. Surface area of Clyde Dive determined from HIR (GLC, 2022b); 210 m length, and 16 m width, 26 m depth, meaning a combined surface area of 14,280 m^2 [Wall 1 (210 m x 26 m) + Wall 2 (210 m x

26 m) + basement (210 m x 16 m)]. Therefore, a maximum seepage rate of 1.7 m^3/d. This seepage rate is for operational design and so is not appropriate for construction, however estimated inflow is currently below operational criteria.

5.4.4 Parramatta

The ground model and hydrogeological parameters for Parramatta is detailed in **Table 21**. The following groundwater monitoring wells were used/not used in the inflow estimation:

- SMW_BH002_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well
- SMW_BH004_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well

Table 21 Ground model and hydrogeological parameters used for Parramatta

Unit	From[a] (m)	To[a] (m)	Thickness[a] (m)	Hydraulic conductivity[a] (m/d)	Specific Storativity[a] (1/m)
Alluvium	10	-2	12	0.1	-
Ashfield Shale	-2	-7	5	0.076	5.00×10^{-6}
Hawkesbury Sandstone	-7	-20[b]	13	0.22	-
Representative hydraulic conductivity				0.18	

a = parameters taken from the HIR GLC (2022b)
b = base of aquifer defined as the base of excavation, defined in the HIR GLC (2022b)

Appendix J – groundwater inflow estimates shows the corresponding groundwater inflow for each well used in the estimate, with **Table 22** summarising the estimate inflows of the monitoring period.

Table 22 Groundwater inflow estimates into Parramatta over the reporting period

Groundwater monitoring well	Distance to excavation (m)	Average groundwater inflow estimate (Jun 24 to Oct 24) (m^3/d)	Average groundwater inflow estimate (m^3/d)	Maximum allowable groundwater seepage (m^3/d)[a]	Total groundwater inflow estimate over 6 months (m^3)
SMW_BH002_w 30.0	0.9	1.0		134.0	194.3
SMW_BH004_w	160.0	1.2			

a = Project construction groundwater monitoring program (GLC, 2024)

5.4.5 Westmead

The ground model and hydrogeological parameters for Westmead is detailed in **Table 23**. The following groundwater monitoring wells were used/not used in the inflow estimation:

- SMW_WTP_BH03A_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well

- SMW_WTP_BH02_w: No – drawdown is not observed at this groundwater monitoring well. This is likely due to being topographically upgradient from the excavation and therefore will not contribute to groundwater inflow into the excavation
- SMW_BH008_w: Yes – groundwater drawdown observed at the groundwater monitoring well and calculations show that the Cooper-Jacob equation is valid for this groundwater monitoring well

Table 23 Ground model and hydrogeological parameters used for Westmead station

Unit	From[a] (m)	To[a] (m)	Thickness[a] (m)	Hydraulic conductivity[a] (m/d)	Specific Storativity[a] (1/m)	Specific Yield[a] (-)
Residual	35.0	25.0	10.0	0.1	-	-
Ashfield Shale	25.0	-6.0[a,b]	31.0	0.01	5.00×10^{-6}	0.005

Table 24 Groundwater inflow estimates into Westmead station over the reporting period

Groundwater monitoring well	Distance to excavation (m)	Average groundwater inflow estimate (Jun 24 to Oct 24) (m^3/d)	Average groundwater inflow estimate (m^3/d)	Maximum allowable groundwater seepage (m^3/d)[a]	Total groundwater inflow estimate over 6 months (m^3)
SMW_WTP_BH03A_w	87.0	12.4	14.4	100.0	2,683.6
SMW_BH008_w	180.0	16.4			

a = Project construction groundwater monitoring program (GLC, 2024)

5.5 Groundwater Quality

A summary of groundwater exceedances against the generic water quality criteria is provided in **Appendix B – Tables**. In general, the following contaminants were found to exceed generic water quality criteria, which are likely to be due to historical contamination issues as indicated by historic data:

- Metals
  - Copper and zinc exceedances were identified in all monitoring sites
  - Nickel exceedances were identified in Clyde MSF and Rosehill
- Nutrients
  - Ammonia exceedances were identified in Clyde MSF, Clyde Dive, and Westmead
  - Nitrate exceedances were identified in Clyde MSF, Rosehill, and Parramatta
  - Nitrogen exceedances were identified in all monitoring sites

- Chlorobenzene
  - Chlorobenzene exceedances were only identified in Clyde MSF (SMW_WTP_BH25_s) for both the August and October GMEs
- PFOS
  - PFOS exceedances against the 99% species protection were identified in Clyde MSF, Clyde Dive, and Parramatta
  - PFOS exceedances against the 95% species protection were identified in Parramatta (August GME only, PM_BH14_w)

5.5.1 Performance Criteria Assessment (Water Quality)

Reportable changes in the performance criteria for water quality has been assessed for the August 2024 and October 2024 GME, comparted to the performance criteria in the Rev D GMP.

This assessment has been undertaken by a suitably qualified hydrogeologist.

5.5.1.1 August 2024 GME

The reportable changes in groundwater quality are detailed in **Table 25**. For these parameters, a Mann-Kendall analysis was undertaken, with none of the trends considered statistically significant. These Mann Kendall plots are shown in **Appendix G – Mann Kendall trend analysis**. Therefore, no further review is required and these GWMWs will be monitored at a quarterly frequency.

Table 25 August 2024 GME reportable changes in groundwater quality

Zone	GWMW	Analyte	Guideline	Trigger	Unit	Jan 24	May/Jun 24	August 24
Clyde MSF	SMW_WTP_BH25_s	Ammonia	a	1.9	mg/L	**16.2**	**15.4**	**5.84**
		Total Nitrogen	a	2.32	mg/L	**16.2**	**17.8**	**12.6**
		Chlorobenzene	b	55	µg/L	**826**	**686**	**296**

5.5.1.2 October 2024 GME

The reportable changes in groundwater quality are detailed in **Table 29**. The Mann-Kendall analysis is shown in **Appendix G – Mann Kendall trend analysis**. The Mann-Kendall analysis identified that most of these parameters are not statistically significant and can return to quarterly monitoring.

Statistically significant reportable changes were identified for the following parameters:

- PM_BH14_w – Copper
- SMW_WTP_BH03A_w – Total Phosphorus

Therefore, a risk assessment was completed to determine whether management actions were required, in accordance with **Section 4.2.1** and **Figure 2**.This risk assessment, detailed in

Appendix H – Reportable Changes Risk Assessment, identified that management actions **were not required**, and quarterly monitoring of these parameters can continue.

The following potential increasing trends, provided in **Table 30**, were identified in the October 2024 GME, and will be checked in the successive quarterly monitoring rounds.

The August 2024 GME identified potential increases which have been checked during the October 2024 GME and are presented in **Table 31**.

Table 29 October 2024 GME reportable changes in groundwater quality

Monitoring zone	GWMW ID	Analyte	Guideline	Trigger	Unit	May/June 2024 GME	Aug 2024 GME	Oct 2024 GME	Assessment

5.5.2 Performance Criteria Assessment (Salinity)

This assessment has been undertaken by a suitably qualified hydrogeologist.

Reportable changes in the performance criteria for salinity has been completed for the August 2024 and October 2024 GMEs, using the Rev D GMP. No reportable changes in salinity were measured. Salinity measurements are shown in **Appendix I – Salinity and pH in-situ Measurements**.

5.5.3 Performance Criteria Assessment (Acid Sulfate Soils)

This assessment has been undertaken by a suitably qualified hydrogeologist.

Reportable changes in the performance criteria for acid sulfate soils has been completed for the August 2024 and October 2024 GMEs, using the Rev D GMP. No reportable changes in pH were measured. The pH measurements are shown in **Appendix I – Salinity and pH in-situ Measurements**.

5.6 Water Treatment Plants

5.6.1 Results

5.6.1.1 Rosehill Permanent Water Treatment Plant

During the reporting period, eleven (11) sampling events occurred at the Rosehill Permanent Water Treatment Plant. Each sampling event consisted of a sample collected pre-treatment and a sample collected post-treatment. The post-treatment results are specified in **Table 32**.

Table 32 Post Treatment Rosehill WTP Sampling Results within Reporting Period (next page)

5.6.1.2 Westmead Permanent Water Treatment Plant

The Westmead permanent water treatment plant, identified as Point 3, was commissioned on 10th January 2024. It was operating to discharge until 19th January 2024. Following this, the demand to reuse treated water onsite matched that of the supply from the water treatment plant and there has been no discharge to the environment since.

There have been no sampling events for the Westmead water treatment plant over the reporting period.

5.6.1.3 Parramatta Construction Water Treatment Plant

During the reporting period, eight (8) sampling events occurred at the Parramatta Construction Water Treatment Plant. Each sampling event consisted of a sample collected pre-treatment and a sample collected post-treatment. The post-treatment results are specified in **Table 33.**

5.6.2 Discussion

5.6.2.1 Rosehill Permanent Water Treatment Plant

Over the reporting period, there have been two sampling events that returned elevated concentrations of analytes requiring a secondary sample to be undertaken. These are noted below:

- 16th October 2024 returned elevated results for Nitrogen (total), 1,700ug/L compared to the 1,200ug/L licence criteria
- 16th December 2024 returned elevated results for Nitrogen (Total) and Oxidised Nitrogen. With results of Nitrogen (total) 1,800ug/L and Oxidized Nitrogen 1,600ug/L compared to the 1,200ug/L licence criteria.

As per the results, all other (8) sampling events undertaken during the reporting period have not returned elevated concentrations compared to the criteria outlined in the EPL 21676 for the Rosehill Permanent Water Treatment Plant.

On December 19th 2024, a variation to the EPL was approved to support the increased discharge criteria for Chromium VI and Total Nitrogen. 50th Percentile and 100th Percentile limits for Chromium VI of 15ug/L and 30ug/L, respectively. 90th Percentile and 100th Percentile limits for Total Nitrogen of 1200ug/L and 1800ug/L, respectively.

5.6.2.2 Westmead Permanent Water Treatment Plant

The Westmead Permanent Water Treatment Plant was commissioned on 10th January 2024 following three (3) daily compliant results. It was operating to discharge until 19th January 2024. All sampling events undertaken during the reporting period were compliant with the discharge requirement of the EPL 21676 for the Westmead Permanent Water Treatment Plant.

As the Westmead station box and mined tunnels have not encountered significant volumes of groundwater, the demand to reuse treated water onsite matched that of the supply from the water treatment plant and there has been no discharge to the environment since 19th January 2024.

5.6.2.3 Parramatta Construction Water Treatment Plant

The Parramatta Construction Water Treatment Plant was commissioned after three (3) subsequent compliant results were returned on the 8th March 2024. As per the results, all sampling events undertaken during the reporting period were compliant with the discharge requirement of the EPL 21676 for the Parramatta Construction Water Treatment Plant.

Over the reporting period, there were two periods where the demand to reuse treated water on-site has matched that of supply from the Parramatta construction water treatment plant and there was a suspension in discharge to the environment. These periods have included:

- 18th July 2024 to 31st July 2024
- 15th August 2024 to 16th August 2024

When on-site demand was reduced, water quality monitoring was undertaken and continuous discharge recommenced from the Parramatta Construction Water Treatment Plant in accordance with the requirements of EPL 21676.

6 CONCLUSION

6.1 Overview

Groundwater quality and level results from the August 2024 GME and October 2024 GME indicate that the majority of locations are comparable to applicable baseline results. However, it is noted that the monitoring network is constantly changing due to ongoing construction works across the project. The changing network continues to be sufficient to inform this monitoring report.

Each GME ensures that a representative number of samples are taken and gauged, to ensure that comparable changes in groundwater quality and level can be observed. The GMP's groundwater quality performance criteria are area and aquifer specific, rather than GWMW specific. This allows for managing the changes in the groundwater network.

6.2 Groundwater Level

For groundwater level monitoring, reportable changes were identified at five GWMWs. These GWMWs are in the Clyde Dive and Rosehill area where dewatering activities are currently taking place. Reportable changes were identified from comparing current drawdown to modelled predictions of drawdown. There are no reportable changes when comparing to AIP criteria. Therefore, the recommended action is to continue monitoring of the groundwater level and drawdown.

For SMW_ADD_BH02_w, a replacement GWMW (GALC_MW16_w) has been used to monitor groundwater level drawdown. This GWMW is being monitored as part of the geotechnical groundwater monitoring. For SMW_ENV042_w, a logger has been installed in CZ4e_MW02 (manual measurements of SWL have been recorded since October 2022), and no reportable changes have been identified.

Inflow estimates into the excavations for the reporting period have been calculated from drawdown, using the Cooper-Jacob method. These are detailed in **Section 5.4** and are based on the observed groundwater drawdown from the GWMW network.

6.3 Groundwater Quality

Reportable changes in groundwater quality were identified in both the August and October 2024 GMEs, which are detailed below in **Table 34**.

Table 34: Summarises the reportable changes in groundwater quality in the August and October 2024 monitoring events.

August 2024 GME	October 2024 GME
• Clyde MSF – SMW_WTP_BH25_s ○ Ammonia ○ Total nitrogen ○ Chlorobenzene – CZ1_BH13 ○ PFOS	• Clyde MSF – SMW_WTP_BH25_s ○ Ammonia ○ Total nitrogen ○ Chlorobenzene – SMW_WTP_BH25_w ○ Total nitrogen

August 2024 GME	October 2024 GME
• Parramatta – SMW_BH004_s o Copper o Nitrate o	– CZ1_BH13 o PFOS • Clyde Dive – GALC_MW16_w o Total phosphorus – SMW_ENV009_w o Total phosphorus • Parramatta – PM_BH14_w o Copper – SMW_BH004_s o Copper o Nitrate • Westmead – SMW_WTP_BH03A_w o Total phosphorus

The Mann Kendall analysis for these reportable events is shown in **Appendix G – Mann Kendall trend analysis**. Reportable changes from the August 2024 GME were not considered statistically significant. For the From this analysis, two reportable events were considered statistically significant:

Parramatta

- PM_BH14_w (copper)

Westmead

- SMW_WTP_BH03A_w (total phosphorus)

Therefore, a risk assessment was completed to determine whether management actions were needed, in accordance with the Rev D GMP **(Section 4.2)**. The risk assessment determined that management actions were not needed, and continuation of quarterly monitoring is required. The risk assessment is detailed in **Appendix H – Reportable Changes Risk Assessment**.

6.4 Water Treatment Plants

The Westmead, Parramatta and Rosehill Water Treatment Plants were operating during the reporting period. At the Rosehill, Parramatta and Westmead sites, there continues to be a high demand for recycled water to be utilised as part of key construction activities and as a result discharge to the environment has been reduced or suspended on occasion. When on-site demand is reduced, water quality monitoring is once again undertaken and continuous discharge recommences in accordance with the requirements of EPL 21676.

Trip Spike Recoveries. Where no lab LCL and UCL is available, user defined limits between 30% and 150% have been adopted for non-compliance.

*** Sample TRIP SPIKE contains volatile compounds spiked into the sample containers prior to dispatch from the laboratory. BTEXN compounds spiked at 20 ug/L**

***RPDs have only been considered where a concentration is greater than 1 times the EQL.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 50 (1 - 10 x EQL); 50 (10 - 30 x EQL); 50 (> 30 x EQL))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory**
